

Highlights of Women's Earnings in 2008

U.S. Department of Labor
U.S. Bureau of Labor Statistics
July 2009

Report 1017

Introduction

In 2008, women who were full-time wage and salary workers had median weekly earnings of \$638, or about 80 percent of the \$798 median for their male counterparts. In 1979, the first year for which comparable earnings data are available, women earned about 62 percent as much as men. After a gradual rise in the 1980s and 1990s, the women's-to-men's earnings ratio peaked at 81 percent in 2005 and 2006. (See chart 1 and tables 1 and 12.)

This report presents earnings data from the Current Population Survey (CPS), a national monthly survey of approximately 60,000 households conducted by the U.S. Census Bureau for the U.S. Bureau of Labor Statistics. Information on earnings is collected from one-fourth of the CPS sample each month. Readers should note that the comparisons of earnings in this report are on a broad level and do not control for many factors that can be significant in explaining earnings differences. For a detailed description of the source of the data and an explanation of the concepts and definitions used, see the accompanying technical note.

Highlights

Full-time workers

- Median weekly earnings were highest for women and men aged 45 to 64. Within this broad age range, there was little difference in the earnings of 45- to 54-year-olds and 55- to 64-year-olds (\$707 and \$711, respectively, for women and \$944 and \$943, respectively, for men). Young women and men aged 16 to 24 had the lowest earnings at \$420 and \$461, respectively. (See table 1.)
- Women aged 35 and older earned about 75 percent as much as their male counterparts. Among younger workers, the earnings differences between women and men were not as great. Women earned about 89 percent as much as men among workers 25 to 34 years old, and 91 percent as much among 16- to 24-year-olds. (See table 1.)
- Between 1979 and 2008, the earnings gap between women and men narrowed for most age groups. The women's-to-

men's earnings ratio among 25- to 34-year-olds, for example, rose from 68 percent in 1979 to 89 percent in 2008, and the ratio for 45- to 54-year-olds increased from 57 percent to 75 percent. The earnings ratios for teenagers (87 percent in 2008) and for workers aged 65 and older (75 percent in 2008) fluctuated from 1979 to 2008, but their long-term trends have been essentially flat. (See table 12.)

- Asian women and men earned more than their white, black, and Hispanic counterparts in 2008. Among women, whites (\$654) earned 87 percent as much as Asians (\$753), while blacks (\$554) and Hispanics (\$501) earned 74 percent and 67 percent as much, respectively. In comparison, white men (\$825) earned 85 percent as much as Asian men (\$966), black men (\$620) earned 64 percent as much, and Hispanic men (\$559), 58 percent. (See chart 2 and tables 1 and 14.)
- Earnings differences between women and men were widest for Asians and for whites. Asian women and white women earned just under 80 percent as much as their male counterparts in 2008. By comparison, black women and Hispanic women had earnings that were around 90 percent of those of their male counterparts. (See table 1.)
- Across the major race and Hispanic ethnicity categories, women's inflation-adjusted earnings grew from 1979 to 2008 while those for men were flat or down. Among women, growth in real earnings for white women has outpaced that of their black and Hispanic counterparts. Between 1979 and 2008, inflation-adjusted earnings for white women rose by 29 percent, while earnings growth among black and Hispanic women was 19 percent and 15 percent, respectively. In contrast, real earnings for white men and for black men in 2008 were about the same as they were in 1979, while Hispanic men's earnings fell by about 8 percent. (See table 15.)

The Consumer Price Index research series using current methods—CPI-U-RS—is used to convert current dollars to constant dollars for the inflation-adjusted comparisons in this report. Asians could not be included in this analysis because of the limited comparable data series available. (See note in table 15.)

- Women's long-term earnings growth reflects, in part, gains in their education levels and their movement into higher paying occupations over time. Although men's educational attainment also has improved since 1979, the relative gains have not been as great, nor has the occupational distribution of employed men changed as significantly as that of women. In 1979, among women aged 25 to 64 in the civilian labor force, 20 percent were high school dropouts, 45 percent had only a high school diploma, and 35 percent had been to college. By 2008, just 7 percent lacked a high school diploma, 27 percent had a high school diploma, and 66 percent had been to college after high school. Among 25-to 64-year-old men in the civilian labor force, the proportion of high school dropouts fell from 23 to 11 percent over the same period, the proportion of high school graduates with no college went from 36 to 30 percent, and the share with some college or a college degree increased from 41 to 59 percent.

Data for 1979 are based on the March CPS; data for 2008 are annual averages. Prior to 1992, educational attainment data were based on the number of years of school completed. Since 1992, the data reflect the highest diploma or degree received. These historical educational attainment data are published in the annual CPS report, *Women in the Labor Force: A Databook*, online at <http://www.bls.gov/cps/wlf-table9-2008.pdf>.

- Median weekly earnings vary significantly by educational level. Among both women and men aged 25 and older, the weekly earnings of those without a high school diploma (\$378 for women and \$497 for men) were less than half of those with a college degree (\$955 for women and \$1,285 for men) in 2008. Women and men with a high school diploma but no college earned about 55 percent of what college graduates did. (See tables 1 and 6.)
- At all levels of education, women have fared better than men with respect to earnings growth. Although both women and men with less than a high school diploma have experienced declines in inflation-adjusted earnings since 1979, the drop for women was significantly less than that for men—10 percent as opposed to 29 percent. Earnings for women with college degrees have increased by 31 percent since 1979 on an inflation-adjusted basis, while those of male college graduates have risen by 18 percent. (Data pertain to workers aged 25 and older.) (See chart 3 and table 17.)
- Women working in full-time management, business, and financial operations jobs had median weekly earnings of \$941 in 2008, more than women earned in any other major occupational category. The second-highest paying job group was professional and related occupations, in which women earned \$867 per week. In management, business,

and finance, the highest paying occupations for women were chief executives and computer and information systems managers. Within professional and related occupations, women working as pharmacists or lawyers had the highest median weekly earnings. (See table 2.)

- The occupational distributions of female and male full-time workers differ significantly. Relatively few women work in construction, production, or transportation occupations, and women are far more concentrated in administrative support jobs. (See chart 4 and table 2.)
- Although women are more likely than men to work in professional and related occupations, they are not as well represented in the higher paying job groups within this broad category. In 2008, only 9 percent of female professionals compared with 45 percent of male professionals were employed in the high-paying computer and engineering fields. Professional women were more likely to work in the education and health care occupations, in which pay was generally lower. Sixty-eight percent of female professionals worked in these fields in 2008, compared with 29 percent of male professionals. (See table 2.)
- The ratio of female-to-male earnings varied by place of residence, ranging from 68 percent in Wyoming to 92 percent in the District of Columbia. The differences among the States reflect, in part, variation in the occupations and industries found in each State and in the age composition of each State's labor force. Sampling error for the State estimates is considerably larger than it is for the national estimates; thus, comparisons of State estimates should be made with caution. (See table 3.)
- Median weekly earnings for married women and men were higher than those for their unmarried counterparts. As a group, married workers tend to be older and so are more likely to be in their prime earning years. Among married workers of either sex, the earnings of those with children under age 18 differed only slightly from those without children. Among unmarried workers, women without children earned 13 percent more than those with children. The opposite was true among unmarried men: those with children earned 11 percent more than those with no children. (See table 8.)
- Among full-time workers, that is, those working 35 hours or more per week in a job, men were more likely than women to have a longer workweek. In 2008, 26 percent of men working full-time jobs had workweeks of 41 hours or more, compared with 14 percent of female full-time workers. Women were 3 times as likely as men to work 35 to 39 hours per week—12 percent as opposed to 4 percent. A majority of both male and female full-time workers had a

40-hour workweek; among these workers, women earned 87 percent as much as men. (See table 5.)

Part-time workers

- Women are more likely than men to work part time, that is, fewer than 35 hours per week in her sole or principal job. Women who worked part time made up 24 percent of all female wage and salary workers in 2008. In contrast, only 11 percent of men in wage and salary jobs worked part time. These proportions have not changed much over time. (See tables 4 and 5.)
- Median weekly earnings of female part-time workers were \$223, compared with \$209 for their male counterparts. The lower earnings for men in part reflect the fact that male part-time workers are more concentrated in the youngest age groups, which typically have low earnings. About half of male part-timers were 16 to 24 years old, compared with just under a third of female part-timers. (See table 4.)

Workers paid by the hour

- Sixty-one percent of women and 56 percent of men employed in wage and salary jobs were paid by the hour in 2008. Women who were paid hourly rates had median

hourly earnings of \$11.49, 85 percent of the median for men paid by the hour (\$13.46). (See tables 9, 10, and 18-22.)

- Among workers who were paid hourly rates in 2008, 4 percent of women and 2 percent of men had hourly earnings at or below the prevailing Federal minimum wage. (See tables 11 and 22.)

On July 24, 2008, the Federal minimum wage level rose from \$5.85 to \$6.55 an hour. Minimum wage data in this report reflect the average number of workers who earned \$5.85 or less from January 2008 through July 2008 and those who earned \$6.55 or less from August 2008 through the end of the year. For information about workers with earnings below the Federal minimum wage, see the accompanying technical note.

- Among both women and men, hourly paid workers aged 16 to 19 were the most likely to have earnings at or below the minimum wage. Eleven percent of all teenage workers earned the prevailing Federal minimum wage or less, compared with just 2 percent of hourly paid workers aged 25 and older. Among those aged 20 to 24, about 6 percent had earnings at or below the minimum wage. (See table 11.)

¹ Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of male and female employees by occupation, industry, firm size, or geographic region.

² Data refer to members of a labor union or an employee association similar to a union.

³ Data refer to workers who report no union affiliation but whose jobs are covered by a union or an employee association contract, as well as to members of a labor union or an employee association similar to a union.

⁴ Includes persons with a high school diploma or equivalent.

⁵ Includes persons with a bachelor's, master's, professional, or doctoral degree.

NOTE: Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

¹ Includes persons with a high school diploma or equivalent.

² Includes persons with a bachelor's, master's, professional, or doctoral degree.

NOTE: Ten percent of all full-time wage and salary workers earn less than the upper limit of the first decile; 25 percent earn less than the upper limit of the first quartile; 50 percent earn less than the upper limit of the

second quartile, or median; 75 percent earn less than the upper limit of the third quartile; and 90 percent earn less than the upper limit of the ninth decile. Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

Table 7. Distribution of full-time wage and salary workers, by usual weekly earnings and selected characteristics, 2008 annual averages

¹ Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of male and female employees by occupation, industry, firm size, or geographic region.

² Data refer to members of a labor union or an employee association similar to a union.

³ Data refer to workers who report no union affiliation but whose jobs are covered by a union or an employee association contract, as well as to members of a labor union or an employee association similar to a union.

⁴ Includes persons with a high school diploma or equivalent.

⁵ Includes persons with a bachelor's, master's, professional, or doctoral degree.

NOTE: Workers paid by the hour account for approximately three-fifths of all wage and salary workers. Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

Men.....	30,533	203	56	151	2,308	4,385	4,416	5,181	6,102	7,730	
Black or African American.....	9,866	79	10	92	1,252	2,110	1,690	1,903	1,481	1,247	
Women.....	5,457	50	6	52	822	1,232	979	1,001	710	605	
Men.....	4,408	29	4	40	430	878	712	902	771	642	
Asian.....	2,844	31	5	18	213	501	412	447	486	731	
Women.....	1,543	18	1	9	137	302	232	241	240	363	
Men.....	1,301	13	4	9	76	199	180	206	246	369	
Hispanic or Latino ethnicity.....	13,070	101	22	84	1,452	3,111	2,408	2,342	1,998	1,551	
Women.....	5,313	61	12	49	846	1,462	925	844	677	437	
Men.....	7,756	40	10	35	606	1,649	1,483	1,499	1,321	1,114	

NOTE: Workers paid hourly rates represent approximately three-fifths of all wage and salary workers. Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race. Dash indicates data not available or do not meet publication standards.

Table 11. Wage and salary workers paid hourly rates with earnings at or below the prevailing Federal minimum wage, by selected characteristics, 2008 annual averages

(Numbers in thousands)

Table 11. Wage and salary workers paid hourly rates with earnings at or below the prevailing Federal minimum wage, by selected characteristics, 2008 annual averages—Continued

(Numbers in thousands)

Characteristic	Workers paid hourly rates				
	Total	Below prevailing Federal minimum wage	At prevailing Federal minimum wage	Total at or below prevailing Federal minimum wage	Percent of workers paid hourly rates
				Number	
RACE, HISPANIC OR LATINO ETHNICITY, AND SEX					
White.....	60,464	1,568	215	1,783	2.9
Women.....	29,931	1,073	151	1,224	4.1
Men.....	30,533	495	65	560	1.8
Black or African American.....	9,866	259	49	308	3.1
Women.....	5,457	154	32	186	3.4
Men.....	4,408	105	17	122	2.8
Asian, 16 years and older.....	2,844	58	11	69	2.4
Women.....	1,543	34	8	42	2.7
Men.....	1,301	24	3	27	2.1
Hispanic or Latino ethnicity.....	13,070	285	39	324	2.5
Women.....	5,313	168	23	191	3.6
Men.....	7,756	117	15	132	1.7
FULL- AND PART-TIME STATUS AND SEX¹					
Full-time workers.....	56,837	778	95	873	1.5
Women.....	25,474	464	68	532	2.1
Men.....	31,363	313	27	340	1.1
Part-time workers.....	18,334	1,162	191	1,353	7.4
Women.....	12,431	837	128	965	7.8
Men.....	5,903	325	63	388	6.6

¹ The distinction between full- and part-time workers is based on hours usually worked. These data do not sum to totals because full- or part-time status on the principal or main job is not identifiable for a small number of multiple jobholders.

NOTE: Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Historical Comparability section of the Household Data technical documentation provided at http://www.bls.gov/cps/eetech_methods.pdf.

NOTE: As of 2003, estimates for the above race groups (white, black or African American, and Asian) include persons who selected this race

group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race. Persons whose ethnicity is identified as Hispanic or Latino may be of any race. Data for 2000-2002 are for the category Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. Dash indicates data not available.

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Historical Comparability section of the Household Data technical documentation provided at http://www.bls.gov/cps/eetech_methods.pdf.

NOTE: As of 2003, estimates for the above race groups (white, black or African American, and Asian) include persons who selected this race group

only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race. Persons whose ethnicity is identified as Hispanic or Latino may be of any race. Data for 2000-2002 are for the category Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. Dash indicates data not available.

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Historical Comparability section of the Household Data technical documentation provided at http://www.bls.gov/cps/eetech_methods.pdf.

NOTE: As of 2003, estimates for the above race groups (white, black or African American, and Asian) include persons who selected this race group only; persons who selected more than one race

group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race. Persons whose ethnicity is identified as Hispanic or Latino may be of any race. Data for 2000-2002 are for the category Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. Dash indicates data not available. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. See Technical Note.

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Historical Comparability section of the Household Data technical documentation provided at http://www.bls.gov/cps/eetech_methods.pdf.

² Data for 1990-91, 1996-97, and 2007-08

reflect changes in the minimum wage that took place in those years.

NOTE: The prevailing Federal minimum wage was \$2.90 in 1979, \$3.10 in 1980, and \$3.35 in 1981-89. The minimum wage rose to \$3.80 in April 1990, to \$4.25 in April 1991, to \$4.75 in October 1996, to \$5.15 in September 1997, to \$5.85 in July 2007, and to \$6.55 in July 2008. See Technical Note for more information about minimum wage workers.

Technical Note

The estimates in this report were obtained from the Current Population Survey (CPS), which provides a wide range of information on the labor force, employment, and unemployment. The survey is conducted monthly for the U.S. Bureau of Labor Statistics (BLS) by the U.S. Census Bureau, using a national sample of about 60,000 households, with coverage in all 50 States and the District of Columbia. The earnings data are collected from one-fourth of the CPS monthly sample.

Material in this report is in the public domain and may be used without permission. This information is available to sensory-impaired individuals upon request. Voice telephone: (202) 691-5200; Federal Relay Service: 1-800-877-8339.

Concepts and definitions

The principal concepts and definitions used in connection with the earnings data in this report are described next.

Usual weekly earnings. Data are collected on wages and salaries before taxes and other deductions, and include any overtime pay, commissions, or tips usually received (at the principal or main job in the case of multiple jobholders). All self-employed workers are excluded, both those with incorporated businesses as well as those with unincorporated businesses. Prior to 1994, respondents were asked how much they usually earned per week. Since January 1994, respondents have been asked to identify the easiest way for them to report earnings (hourly, weekly, biweekly, twice monthly, monthly, annually, or other) and how much they usually earn in the period reported. Earnings reported on a basis other than weekly are converted to a weekly equivalent. The term "usual" is as perceived by the respondent. If the respondent asks for a definition of "usual," interviewers are instructed to define the term as "more than half the weeks worked during the past 4 or 5 months."

Medians (and other quantiles) of weekly earnings. Most of the earnings estimates shown in this report are medians. The median (or upper limit of the second quartile) is the amount that divides a given earnings distribution into two equal groups, one having earnings above the median and the other having earnings below the median. Ten percent of workers in a given distribution have earnings below the upper limit of the first decile (90 percent have higher earnings), 25 percent have earnings below the upper limit of the first quartile (75 percent have higher earnings), 75 percent have earnings below the upper limit of the third quartile (25 percent have higher earnings), and 90 percent have earnings below the upper limit of the ninth decile (10 percent have higher earnings).

The BLS estimating procedure for determining the median of an earnings distribution places each reported or calculated weekly earnings value into a \$50-wide interval that is centered around a multiple of \$50. The median is estimated through the linear interpolation of the interval in which the median lies.

Over-the-year changes in the medians (and other quantile boundaries) for specific groups may not necessarily be consistent with the movements estimated for the overall quantile boundary. The most common reasons for this possible anomaly are as follows:

- There could be a change in the relative weights of the subgroups. For example, the medians of both 16- to 24-year-olds and those 25 years and older may rise, but if the lower earning 16-to-24 age group accounts for a greatly increased share of the total, the overall median could actually fall.
- There could be a large change in the shape of the distribution of reported earnings, particularly near a quantile boundary. This change could be caused by survey observations that are clustered at rounded values—for example, \$300, \$400, or \$500. An estimate lying in a \$50-wide centered interval containing such a cluster, or "spike," tends to change more slowly than one in other intervals. For example, medians measure the central tendency of a multipeaked distribution that shifts over time. As such a distribution shifts, the median does not necessarily move at the same rate. Specifically, the median takes relatively more time to move through a frequently reported interval, but once above the upper limit of such an interval, it can move relatively quickly to the next frequently reported earnings interval. BLS procedures for estimating medians (and other quantile boundaries) mitigate such irregular movements of the measures; however, users should be cautious of these effects when evaluating short-term changes in the medians and in ratios of the medians.

Constant dollars. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. BLS has made numerous improvements to the Consumer Price Index (CPI) over the years. Although these improvements make the CPI more accurate, the official histories of price index series are not adjusted to reflect the improvements. Because many researchers need a historical series that measures price change consistently over time, BLS developed the CPI-U-RS to provide an estimate of the CPI that incorporates most of the methodological improvements made since 1978 into the entire series. For further information, see Kenneth J. Stewart and Stephen B. Reed, "CPI research series using current methods, 1978-98" *Monthly Labor Review*, June 1999 (<http://www.bls.gov/opub/mlr/1999/06/art4full.pdf>); and "Questions and Answers: Consumer Price Index Research Series Using Current Methods," on the Internet at <http://www.bls.gov/cpi/cpirsdc.htm>.

This report uses the most recent version of the CPI-U-RS available at the time of production. Users should note, however, that the CPI-U-RS is subject to periodic revision. As a result, the rate of inflation incorporated into the constant-dollar earnings estimates in this report may differ from that in previous reports in this series or in other publications.

Wage and salary workers. These are workers who receive wages, salaries, commissions, tips, payment in kind, or piece rates. The group includes employees in both the private and public sectors but, for purposes of the earnings series, excludes all self-employed persons, both those with incorporated businesses as well as those with unincorporated businesses.

Full-time workers. For the purpose of producing estimates of earnings, workers who usually work 35 hours or more per week at their sole or principal job are defined as working full time.

Part-time workers. For the purpose of producing estimates of earnings, workers who usually work fewer than 35 hours per week at their sole or principal job are defined as working part time.

Workers paid by the hour. Historically, workers paid an hourly wage have made up approximately three-fifths of all wage and salary workers. Workers paid by the hour are included in the full- and part-time worker tables in this report, along with salaried workers and other workers not paid by the hour. Data for workers paid at hourly rates are presented separately in tables 9 to 11 and 18 to 22.

Workers paid at or below the Federal minimum wage. The estimates of the numbers of workers with reported earnings at or below the Federal minimum wage in tables 11 and 22 pertain only to workers who are paid hourly rates. Salaried workers and other workers who are not paid by the hour are not included, even though some have earnings that, when converted to hourly rates, are at or below the minimum wage. Consequently, the estimates presented in this report likely underestimate the actual number of workers with hourly earnings at or below the minimum wage. Research has shown, however, that the degree of understatement is small. BLS does not routinely estimate the hourly earnings of workers not paid by the hour because of data quality concerns associated with such an estimation process.

The prevailing Federal minimum wage was \$2.90, effective January 1, 1979; \$3.10, effective January 1, 1980; \$3.35, effective January 1, 1981; \$3.80, effective April 1, 1990; \$4.25, effective

April 1, 1991; \$4.75, effective October 1, 1996; \$5.15, effective September 1, 1997; \$5.85, effective July 24, 2007; and \$6.55 effective July 24, 2008. Data for 1990–91, 1996–97, and 2007–08 reflect changes in the minimum wage that took place during those years. Note that some States have established minimum-wage standards that exceed the Federal level.

The presence of workers with hourly earnings below the minimum wage does not necessarily indicate violations of the Fair Labor Standards Act because there are a number of exemptions to the minimum wage provisions of the law. In addition, some workers might have rounded their hourly earnings in response to survey questions. As a result, some might have been reported with hourly earnings below the minimum wage when, in fact, they earned the minimum wage or higher.

Reliability

Statistics based on the CPS are subject to both sampling and nonsampling error. Whenever a sample, rather than an entire population, is surveyed, there is a chance that the sample estimates may differ from the “true” population values they represent. The exact difference, or sampling error, varies with the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the true population value because of sampling error. BLS analyses generally are conducted at the 90-percent level of confidence. Estimates of earnings and their standard errors can be used to construct approximate confidence intervals, or ranges of values, that include the true population value with known probabilities.

The CPS data also are affected by nonsampling error. This kind of error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information on all respondents in the sample, inability or unwillingness of respondents to provide correct information, and errors made in data collection or processing.

For a full discussion of the reliability of data from the CPS and information on estimating standard errors, see the “Reliability of the estimates” section of Household Data technical documentation on the Internet at www.bls.gov/cps/eetech_methods.pdf.
