PRODUCTIVITY AND COSTS
 Second Quarter 2023, Preliminary

Nonfarm business sector labor productivity increased 3.7 percent in the second quarter of 2023, the U.S. Bureau of Labor Statistics reported today, as output increased 2.4 percent and hours worked decreased 1.3 percent. (All quarterly percent changes in this release are seasonally adjusted annual rates.) The decline in hours worked is the first decline since the second quarter of 2020 and was the result of a 1.3-percent decline in average weekly hours; employment was unchanged. From the same quarter a year ago, nonfarm business sector labor productivity increased 1.3 percent, reflecting a 2.6-percent increase in output and a 1.2-percent increase in hours worked; this is the first increase in the four-quarter productivity measure since the fourth quarter of 2021. (See chart 1 and table A1.)

Chart 1. Labor productivity, nonfarm business, 2019Q1 – 2023Q2

Chart 2. Unit labor costs, nonfarm business, 2019Q1 – 2023Q2

Unit labor costs in the nonfarm business sector increased 1.6 percent in the second quarter of 2023, reflecting a 5.5-percent increase in hourly compensation and a 3.7-percent increase in productivity. Unit labor costs increased 2.4 percent over the last four quarters. (See chart 2 and tables A1 and 2.)

BLS calculates unit labor costs as the ratio of hourly compensation to labor productivity. Increases in hourly compensation tend to increase unit labor costs and increases in productivity tend to reduce them. Real hourly compensation, which takes into account consumer prices, increased 2.7 percent in the second quarter of 2023, and declined 0.3 percent over the last four quarters.

Labor productivity, or output per hour, is calculated by dividing an index of real output by an index of

hours worked by all workers, including employees, proprietors, and unpaid family workers. During the current business cycle, starting in the fourth quarter of 2019, labor productivity has grown at an annualized rate of 1.4 percent, as output grew at a 2.0-percent per year rate, outpacing hours worked, which grew at a 0.7-percent annual rate. (See chart 3.) The 1.4-percent annual rate of productivity growth in the current business cycle thus far is below the long-term historical average rate since 1947 of 2.1 percent.

Chart 3. Labor Productivity, Output, and Hours Worked index series, nonfarm business, 2019 Q4 – 2023 Q2

Manufacturing sector labor productivity increased 4.0 percent in the second quarter of 2023, as output increased 1.9 percent and hours worked decreased 2.0 percent. In the durable manufacturing sector, productivity increased 5.2 percent, with a 4.1-percent increase in output and a 1.1-percent decrease in hours worked. Nondurable manufacturing sector productivity increased 3.4 percent, as output decreased 0.1 percent and hours worked decreased 3.4 percent. Total manufacturing sector productivity decreased 1.0 percent from the same quarter a year ago. (See tables A1, 3, 4, and 5.)

Unit labor costs in the total manufacturing sector increased 3.6 percent in the second quarter of 2023, reflecting a 7.8-percent increase in hourly compensation and a 4.0-percent increase in productivity. Manufacturing unit labor costs increased 4.9 percent from the same quarter a year ago. (See tables A1 and 3.)

Chart 4. Labor Productivity, Output, and Hours Worked index series, manufacturing, 2019 Q4 – 2023 Q2

Manufacturing sector labor productivity has increased at an annualized rate of 0.3 percent during the current business cycle, which began in the fourth quarter of 2019. This rate reflects output and hours worked growing at annualized rates of 0.4 percent and 0.1 percent, respectively. (See chart 4.) This slow productivity growth rate follows the 0.0-percent annual rate of growth during the last business cycle that spanned the fourth quarter of 2007 through fourth-quarter 2019.

The concepts, sources, and methods used for the manufacturing output series differ from those used in the business and nonfarm business output series; these output measures are not directly comparable. See the Technical Notes for a more detailed explanation. (See page 6.)

Revised measures

Regular updates of source data published in June and July by the BLS and the Bureau of Economic Analysis (BEA) are reflected in revised data for the first quarter of 2023; labor data scheduled to be published by BLS August 4, 2023 have not yet been incorporated. Regular updates of source data published in June and July by the Board of Governors of the Federal Reserve System are incorporated in revised data for the first quarter of 2023 and the fourth quarter of 2022.

Table B1 presents revised and previously published labor productivity and related measures for the nonfarm business, business, and manufacturing sectors for the first quarter of 2023. Table A2 presents these measures for the nonfinancial corporate sector.

Nonfarm business sector productivity was revised up to a decrease of 1.2 percent in the **first quarter of 2023**; output was revised up to an increase of 1.4 percent and hours worked were not revised. (See table B1.) A downward revision to first-quarter unit labor costs, to a rate of 3.3 percent, resulted from an upward revision to productivity; hourly compensation was not revised.

Manufacturing sector productivity was revised up to a decline of 1.8 percent in the **first quarter of 2023**, primarily reflecting an upward revision to output; hours were revised down slightly. Productivity

was revised up in the durable manufacturing subsector and was not revised in the nondurable manufacturing subsector. In the first quarter of 2023, total manufacturing unit labor costs increased 2.4 percent rather than increasing 3.1 percent as reported June 1; productivity was revised up 0.7 percentage point and hourly compensation was revised up 0.1 percentage point. (See tables B1 and 3.)

Nonfinancial corporate sector productivity was revised up slightly, to a decline of 4.2 percent in the **first quarter of 2023**. Unit labor costs in the nonfinancial corporate sector were revised down slightly, to an increase of 6.7 percent. (See table A2 and 6.)

Quarterly and annual data for all sectors for recent years appear in tables 1-6. Full historical annual and quarterly measures can be found at www.bls.gov/productivity/tables/.

The revised Productivity and Costs news release for second-quarter 2023 is scheduled to be released on Thursday, September 7, 2023, at 8:30 a.m. (ET).

Sector	Percent change from:	Labor productivity	Output	Hours worked	Hourly compensation	Real hourly compensation	Unit labor costs

TECHNICAL NOTES

Labor Hours

Hours worked data for the labor productivity and cost measures include hours worked for all persons working in the sector—wage and salary workers, the self-employed and unpaid family workers. The primary source of hours and employment data is the BLS Current Employment Statistics (CES) program, which provides monthly survey data on the number of jobs held by and hours paid to wage and salary workers in nonfarm establishments, counting a person who is employed by two or more establishments at each place of employment. As of the February 3, 2023 Employment Situation release, the CES program has updated the national nonfarm payroll series to the 2022 North American Industry Classification System (NAICS). The BLS Major Sector Productivity program will be remaining on a NAICS 2017 basis for the time being by converting NAICS 2022 data from CES back to a NAICS 2017 basis using ratios published on the CES website and based on the Quarterly Census of Employment and Wages (QCEW). Hours of paid time off are removed from hours paid using data from the National Compensation Survey (NCS) for 1996 forward and data from the BLS Hours at Work survey, conducted for this purpose, prior to 1990. Between 1990 and 1995, hours of paid time off are removed using a combination of NCS and Hours at Work survey data. Off-the-clock hours are added, yielding hours worked, using data from the Current Population Survey (CPS).

Data from the CPS are used to estimate hours worked for farm labor, nonfarm proprietors, and nonfarm unpaid family workers. Using CPS information on employment and hours worked at primary jobs and all other jobs, separately, the BLS productivity measures assign all hours worked to the appropriate industrial sector. Hours for government enterprises are derived from the CPS, the CES, and the National Income and Product Accounts (NIPA) prepared by the Bureau of Economic Analysis (BEA) of the Department of Commerce.

Detailed hours data are presented in the table “Hours Worked in Total U.S. Economy and Subsectors” on the BLS website (www.bls.gov/productivity/tables/total-economy-hours-employment.xlsx).

Output

Business sector output is a chain-type, current-weighted index constructed after excluding from gross domestic product (GDP) the following outputs: general government, nonprofit institutions, and households (including owner-occupied housing). Corresponding exclusions also are made in labor hours worked. Business output accounted for about 79 percent of the value of GDP in 2022. Nonfarm business, which excludes farming, accounted for about 78 percent of GDP in 2022.

Annual indexes for manufacturing and its durable and nondurable goods components are constructed by deflating current-dollar industry value of production data from the U.S. Bureau of the Census with deflators from the BLS. These deflators are based on data from the BLS Producer Price Index program and other sources. The industry shipments are aggregated using annual weights, and intrasectoral transactions are removed. Quarterly manufacturing output measures are based on the indexes of industrial production prepared monthly by the Board of Governors of the Federal Reserve System, adjusted to be consistent with annual indexes of manufacturing sector output prepared by BLS.

Nonfinancial corporate output is a chain-type, current-weighted index calculated on the basis of the costs incurred and the incomes earned from production. The output measure excludes the following outputs from GDP: general government; nonprofit institutions; households; unincorporated business; and those corporations classified as offices of bank holding companies, offices of other holding companies, or offices in the finance and insurance sector. Nonfinancial corporations accounted for about 51 percent of the value of GDP in 2022.

Labor Productivity

The measure describes the relationship between real output and the labor time involved in its production. Measures of labor productivity growth show the changes from period to period in the amount of goods and services produced per hour worked. They reflect the joint effects of many influences, including changes in technology; capital investment; level of output; utilization of capacity, energy, and materials; the organization of production; managerial skill; and the characteristics and effort of the work force.

Labor Compensation

The measure includes accrued wages and salaries, supplements, employer contributions to employee benefit plans, and taxes. Estimates of labor compensation by major sector, required for measures of hourly compensation and unit labor costs, are based primarily on employee compensation data from the NIPA, prepared by the BEA. The compensation of employees in general government, nonprofit institutions and households are subtracted from compensation of employees in domestic industries to derive employee compensation for the business sector. The labor compensation of proprietors cannot be explicitly identified and must be estimated. This is done by assuming that proprietors have the same hourly compensation as employees in the same sector. The quarterly labor productivity and cost measures do not contain estimates of compensation for unpaid family workers.

Unit Labor Costs

These measures describe the relationship between compensation per hour and labor productivity, or real output per hour, and can be used as an indicator of inflationary pressure on producers. Increases in hourly compensation increase unit labor costs; labor productivity increases offset compensation increases and lower unit labor costs.

Presentation of the data

The quarterly data in this release are presented in three ways: as percent changes from the previous quarter presented at a compound annual rate, as percent changes from the corresponding quarter of the previous year, and as index number series where 2012=100. Annual data are presented both as index number series and percent changes from the previous year.

The index numbers and rates of change reported in the productivity and costs news release are rounded to one decimal place. All percent changes in this release and on the BLS web site are calculated using index numbers to three decimal places. A complete historical series of these index numbers are available at the BLS web site, www.bls.gov/data/home.htm, or by contacting the BLS Division of Major Sector Productivity (Telephone 202-691-5606 or email productivity@bls.gov).

For a more detailed explanation of methodology see the Handbook of Methods at www.bls.gov/opub/hom/msp/home.htm.

August 3, 2023
Source: Bureau of Labor Statistics

SOURCES: Output data are from the Bureau of Economic Analysis and the Census Bureau of the U.S. Department of Commerce; the Bureau of Labor Statistics, U.S. Department of Labor; and the Federal Reserve Board. Hours and compensation data are from the Bureau of Labor Statistics and the Bureau of Economic Analysis.

SIZE OF REVISIONS: Productivity and cost measures are revised on a regular schedule as more complete data become available. The first estimate is published within 40 days of the close of the reference quarter, the second estimate approximately 30 days later, and the third estimate approximately 60 days after the second estimate. Based on past revisions, the third estimate of nonfarm business sector quarterly labor productivity growth has differed from the first estimate by -1.1 to +1.3 percentage point about 80 percent of the time. This interval is based on estimates for reference quarters from the first quarter of 2001 to the fourth quarter of 2022. For more about revisions to labor productivity growth see “Revisions to BLS quarterly labor productivity estimates: How large are they?” at www.bls.gov/opub/mlr/2022/article/revisions-to-bls-quarterly-labor-productivity-estimates-how-large-are-they.htm.

Table Footnotes

- (1) Wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. Except for nonfinancial corporations, where there are no self-employed, data also include an estimate of wages, salaries, and supplemental payments for the self-employed.
- (2) The change for recent quarters is based on the Consumer Price Index for all urban consumers (CPI-U). The trend from 1978-2022 is based on the Consumer Price Index Retroactive series (CPI-URS).
- (3) Unit nonlabor payments include profits, consumption of fixed capital, taxes on production and imports less subsidies, net interest and miscellaneous payments, business current transfer payments, rental income of persons, and the current surplus of government enterprises.
- (4) Current dollar output divided by the output index.
- (5) Quarterly changes: Percent change compounded at annual rate is calculated using index numbers to three decimal places. Indexes published in the news release are rounded to one decimal place for convenience. Annual changes: Percent change is calculated using annual indexes to three decimal places.
- (6) Unit nonlabor costs include consumption of fixed capital, taxes on production and imports less subsidies, net interest and miscellaneous payments, and business current transfer payments.
- (7) Total unit costs are the sum of unit labor and nonlabor costs.
- (8) Unit profits include corporate profits before tax with inventory valuation and capital consumption adjustment.
