In most occupations, those working more than 44 hours per week earned substantially more than those working 35 to 44 hours. Find out in which occupations it may pay to put in long hours.

# Work more, earn more? How hours of work affect occupational earnings 

by Daniel Hecker

Usually, the more hours people work, the more money they earn. But that is not always the case. In choosing an occupation, it is wise to consider the link between earnings and the hours of work required to make those earnings. Some people value a high income over time for leisure or other activities and may be willing to accept a long workweek. Others want a high income but want to achieve that goal with a job that has high hourly earnings rather than long hours. Still other workers may be satisfied working shorter hours and earning more modest incomes.

This article, based on 1997 data from the Current Population Survey, examines the occupations most and least likely to require standard and long hours. Within occupations, it shows how much workers with long workweeks earned compared to their counterparts with standard ones. It also ranks occupations based on workers' weekly earnings, providing a glimpse of which reward more hours with a bigger paycheck.

## Hours and earnings within occupations

Within every occupation, some workers put in longer hours than others. Some people have a standard workweek, defined in this article as 35 to 44 hours; other workers have an extended

[^0]week, defined here as 45 to 99 hours. (Where data exist, some occupations are further broken down into categories of 45 to 54 hours and 55 to 99 hours per week.)

The data are first examined without regard to earnings, revealing the proportion of men and women in different occupations who had extended workweeks. About 30 percent of men usually worked more than 44 hours per week, and 10 percent worked more than 54 hours per week. At least two-thirds of physicians, clergy, and workers in firefighting occupations had extended weeks. In contrast, about 7 percent of men working as janitors and cleaners had extended workweeks. (See table 1.)

Fewer women than men had extended workweeks- 15 percent usually worked more than 44 hours per week, and 3 percent worked more than 45 hours. Occupations in which at least half the women worked extended weeks were physicians, lawyers, and marketing, advertising, and public relations managers. Occupations in which 7 percent or fewer women worked extended weeks include nursing aides, orderlies, and attendants; bookkeepers, accounting, and auditing clerks; and secretaries. (See table 2.)

Earnings data show that in some occupations, workers with extended workweeks reported a large earnings premium-that is, they earned more money for working longer hours. In half the cases, workers with extended workweeks earned at least 32 percent more each week than did those with standard workweeks. However, within some occupations, there was little or no difference in earnings between those who had an extended workweek and those who worked standard weeks.

Among men, for example, some retail sales workers who had

Table 1

${ }^{1}$ Hours for physicians exclude those working more than 74 hours a week because almost all have very low earnings and are presumed to be interns rather than licensed physicians.
${ }^{2}$ n.e.c. $=$ not elsewhere classified
an extended workweek earned 76 percent more than their counterparts who put in a standard week. In contrast, male elementary school teachers who worked extended weeks earned slightly less than those who worked standard ones. (See table 3.)

Among women, sales representatives for financial and business services working an extended week earned 62 percent more than their standard workweek counterparts. But secondary school teachers with an extended workweek earned 3 percent more than those with a standard workweek. (See table 4.)

Some occupational groups had a greater proportion of workers with extended weeks earning more per hour or per week or both than those with standard weeks. Weekly earnings of men with an extended workweek exceeded by at least a third the earnings of men with a standard workweek in 13 of 16 occupations in the executive, administrative, and managerial; management related; and sales occupations groups. Hourly earnings also were higher in those groups for men in 13 of 16 occupations.

Among women, sales occupations showed the greatest dif-
ferential in weekly earnings between those working extended weeks and those working standard weeks; in 3 of 4 occupations, women earned at least 50 percent more. Women sales workers with extended weeks also earned more per hour. In professional specialty occupations, prekindergarten and kindergarten teachers with extended weeks earned 56 percent more per week and 12 percent more per hour.

In some occupations, the earnings of men and women reflected little or no weekly premium for additional hours worked. For example, men and women elementary and secondary teachers earned little more per week and much less per hour for working extended weeks. There were also relatively small differences in weekly earnings and lower hourly earnings for both women and men in computer, engineering, and most administrative support occupations.

Within the extended workweek categories of 45 to 54 hours and 55 to 99 hours, those working 55 to 99 hours earned more per week than did those working 45 to 54 hours in most occupa-

[^1]tions where data were available. However, only male managers in marketing, advertising, and public relations earned more per hour. (See tables 5 and 6.)

## Analysis of hours and earnings

There are several explanations for higher median earnings per week or per hour for those who have an extended workweek. Workers paid by the hour earn more per week the longer they work; and if they are paid more per hour for every hour they work beyond 40, they earn more per hour, as well. For salaried
workers, including most managerial and sales occupations, analyzing the difference between weekly earnings of standard- and extended-week workers is more complex.

Hourly earners include most production workers in mining, manufacturing, and construction; most retail sales workers; cooks; truckdrivers; guards; and nursing aides. Clerical workers, police, and technicians, even if they receive an annual salary, may also be paid for working more than a standard week. In most of these occupations, workers with an extended workweek have higher weekly and hourly earnings. However, in some

## Some hourly

## earners make more

## per hour for

## working over 40

## hours per week.

occupations, such as electricians and nursing aides, orderlies, and attendants, median hourly rates are lower. Lower rates might be consistent with additional pay per hour for overtime hours if certain workers-for example, younger workers or those in low-wage establishments-with extended weeks have lower base hourly rates than do those with standard weeks.

Commission sales workers or piecework production workers who work longer hours may produce more and may therefore earn more per week. Because they are not paid overtime, however, they are not likely to receive additional pay per hour for
working more than 40 hours per week.
For example, workers selling insurance, real estate, automobiles, and other large items usually receive at least part of their pay as commissions based on the value of the products they sell. Those with extended workweeks who receive a commission earn substantially more per week than do their counterparts with a standard workweek. Almost all earn more per hour, as well. But to do so, they must make more sales per hour, get larger commissions or bonuses for being top sellers, or have other characteristics associated with high earnings.

Other workers with extended weeks also may have higher earnings because they may be more likely to have greater responsibilities, higher skill levels, more education, high-wage employers, or other characteristics associated with higher pay than do workers with standard weeks. This includes workers in managerial and professional occupations such as medical and health managers, prekindergarten and kindergarten teachers, and college faculty.

Most managerial and professional workers receive a weekly or annual salary in return for at least 35 to 40 hours of work per week. In some cases, it is understood that an extended workweek is part of the job. For these workers, overtime pay is less common, but they may receive other compensation-such as bonuses, extra benefits, or stock options-not included in these data.

In some of these occupations, workers with extended weeks do not make much more per week and therefore earn much less per hour. This may be because of more modest earnings differentials between job titles within an occupation or because of large earnings differentials with little connection between hours worked and earnings. For example, many teacher salaries increase with years of tenure, are higher in public than in private schools, and vary widely by geographic area. But experienced teachers or those in high-paying school systems might not work longer hours.

Although managerial and professional workers are not likely to receive extra pay for overtime, they may work an extended week for other reasons. It may take more than 44 hours per week to perform their job adequately, or their employer might require them to work more hours. If they are seeking a promotion or a bonus, extra hours may eventually yield a higher income.

## Occupational rankings

Which occupations pay the most per week, and how do these occupations compare with others? Tables 7 and 8 rank occupations by earnings for men and women and show how rankings for those in the standard- and extended-week groups compare with those of all full-time workers.

Table 3

${ }^{1}$ n.e.c. $=$ not elsewhere classified
${ }^{2}$ Earnings for physicians exclude those working more than 74 hours a week because almost all have very low earnings and are presumed to be interns rather than licensed physicians.
Note: There were no reliable data for farming, forestry, and fishing occupations.
(Continued from page 15)
Rankings differed most for men in executive, administrative, and managerial; management related; professional specialty; and sales occupations. Regardless of hours worked, top earners for both men and women included physicians and lawyers. The lowest earners in all hours-worked groups include, for men, farm workers, laborers, janitors and cleaners, guards, and cooks, and for women, nursing aides and private household workers.

For men in most executive, administrative, and managerial; management related; and sales occupations, rankings were lower for the standard-week group but higher for the extendedweek group. For example, male insurance sales workers ranked $20^{\text {th }}$ in data for all workers, $27^{\text {th }}$ in the standard-week group, and $9^{\text {th }}$ in the extended-week group. But men with a standard workweek ranked higher than all workers and those with extended hours in most other occupations, including professional specialty occupations.

Among women, rankings for those with a standard workweek differed little from those for all workers. Women in most executive, administrative, and managerial occupations ranked higher if they worked an extended week. Elementary, secondary, and special education teachers ranked lower.

Despite the overall lower weekly earnings associated with a standard workweek, standard-week workers in some occupations had high median earnings-defined here as a median exceeding that for all workers with an extended workweek-of

## Service occupations, including private household

$\begin{array}{llll}\text { Private household occupations } & 27 & 27 & 27\end{array}$
$\begin{array}{llll}\text { Nursing aides, orderlies, and attendants } & 25 & 25 & 26\end{array}$ n.e.c. $=$ not elsewhere classified
median for all those working 55 hours or more- $\$ 847$ for men and $\$ 723$ for women.

However, these occupations also have other characteristics associated with higher pay. Most notably, all usually require a college degree. Physicians and lawyers need a professional degree, and most college teaching jobs require a doctoral or professional degree. With the exception of registered nurse, which requires an associate degree, the other occupations usually require at least a bachelor's degree.

## Data and methodology

The Current Population Survey is the monthly household survey that provides basic measurements of the labor force and employment. In this article, data reflect usual weekly earnings and usual weekly hours in a worker's primary job. The data cover wage and salary workers (those who work for someone else and receive a paycheck), excluding self-employed workers (those who earn a profit from their own businesses). Self-employed workers, who made up about 8 percent of employed workers in 1997, are more likely than wage and salary workers to have an extended workweek.

Classification by hours worked categories permits comparisons within occupations for workers with different numbers of work hours. It also allows comparisons between occupations for workers with roughly the same number of work hours per week. Because the primary focus is comparisons by hours worked per week, data are presented only for occupations in which there were enough respondents with extended weeks to provide statistically reliable earnings data for this category. Data are presented separately by sex because women usually earn less than men, even in the same occupation, and have shorter workweeks.

Unlike surveys of employers, these data show hours actually worked—not just hours paid for-but do not show the schedule of hours. Although schedules vary, a typical 35- to 44-hour week consists of 5 work days of between 7 and nearly 9 hours. An extended workweek might be at least 9 hours a day or extra hours on an additional work day. For most jobs, work is performed between 6 a.m. and 6 p.m., Monday through Friday. However, some jobs include evening, night, or weekend work; shifts that change periodically from days to evenings or nights; an irregular schedule arranged by the employer; or split shifts, involving two distinct periods each day.
