#### THE EMPLOYMENT SITUATION: JANUARY 2008

Both nonfarm payroll employment, at 138.1 million, and the unemployment rate, at 4.9 percent, were essentially unchanged in January, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The small January movement in nonfarm payroll employment (-17,000) reflected declines in construction and manufacturing and job growth in health care. Average hourly earnings rose by 4 cents, or 0.2 percent, over the month.

# <u>Unemployment (Household Survey Data)</u>

The number of unemployed persons (7.6 million) and the unemployment rate (4.9 percent) were essentially unchanged in January. Over the month, the unemployment rates for all major worker groups—adult men (4.4 percent), adult women (4.2 percent), teenagers (18.0 percent), whites (4.4 percent), blacks

## **Establishment and Household Data Changes**

The establishment survey data in this release have been revised as a result of the annual benchmarking process, the updating of seasonal adjustment factors, and the updating to NAICS 2007 from NAICS 2002. See the note beginning on page 5 for more information on the revisions.

In addition, household survey data for January 2008 reflect updated population controls. See the note on page 6 for more information.

Table A. Major indicators of labor market activity, seasonally adjusted (Numbers in thousands)

	Quarterly	averages		Monthly data	1	Dan Jan
Category	III 2007	IV 2007	Nov. 2007	Dec. 2007	Jan. 2008	DecJan. change
HOUSEHOLD DATA			Labor fo	rce status		
Civilian labor force	153,191	153,667	153,828	153,866	153,824	(1)

<sup>&</sup>lt;sup>1</sup> Changes in household data levels are not shown due to the introduction of updated population controls. See the note on page 6 for more information.

<sup>&</sup>lt;sup>2</sup> Establishment data have been revised to reflect March 2007 benchmark levels, updated seasonal adjustment factors, and conversion to NAICS 2007 from NAICS 2002. See the note on page 5 for more information.

<sup>3</sup> Includes other industries, not shown separately.

<sup>4</sup> Quarterly averages and the over-the-month change are calculated using unrounded data.

<sup>&</sup>lt;sup>5</sup> Data relate to private production and nonsupervisory workers.

p = preliminary.

(9.2 percent), and Hispanics (6.3 percent)—showed little or no change. The unemployment rate for Asians was 3.2 percent, not seasonally adjusted. (See tables A-1, A-2, and A-3.)

# Total Employment and the Labor Force (Household Survey Data)

Total employment and the employment-population ratio edged up in January after accounting for the annual adjustment to the population controls. The civilian labor force also rose when adjustment is made to account for the effect of population control changes. The labor force participation rate (66.1 percent) was about the same as in December. (See tables A-1 and D.)

# Persons Not in the Labor Force (Household Survey Data)

About 1.7 million persons (not seasonally adjusted) were marginally attached to the labor force in Januuary, up from about 1.6 million a year earlier. These individuals wanted and were available for work and had looked for a job sometime in the prior 12 months. They were not counted as unemployed because they had not searched for work in the 4 weeks preceding the survey. Among the marginally attached, there were 467,000 discouraged workers in January, about the same as a year earlier. Discouraged workers were not currently looking for work specifically because they believed no jobs were available for them. The other 1.3 million persons marginally attached to the labor force in January had not searched for work in the 4 weeks preceding the survey for reasons such as school attendance or family responsibilities. (See table A-13.)

# Industry Payroll Employment (Establishment Survey Data)

In January, total nonfarm payroll employment was about unchanged (-17,000), after edging up in November (60,000) and December (82,000). In 2007, payroll employment increased by an average of 95,000 jobs per month. Both construction and manufacturing employment continued to decline in January, and health care employment rose. (See table B-1.)

Construction employment decreased by 27,000 in January and has fallen by 284,000 since its peak in September 2006. Over-the-month job losses occurred in residential building (-10,000) and residential specialty trade contractors (-18,000).

Manufacturing lost 28,000 jobs in January. Over the month, small declines occurred among many durable and nondurable goods industries. Manufacturing has lost 269,000 jobs over the past 12 months.

In the service-providing sector, health care employment continued to grow in January (27,000), about in line with average monthly gains over the prior 12 months. Within health care, over-the-month job gains occurred in ambulatory health care services (14,000), which includes offices of physicians, and in hospitals (10,000).

Food services employment continued to trend upward in January. From November through January, food services added an average of 16,000 jobs per month, compared with an average gain of 28,000 jobs for the 12-month period ending in October.

Employment in professional and technical services was little changed in January following a large increase (49,000) in the prior month. In 2007, job growth in this sector totaled 335,000.

In January, employment in financial activities was about unchanged as commercial banking lost 4,000 jobs, and securities, commodity contracts, and investments added 5,000 jobs. Since reaching a peak in December 2006, employment in financial activities has declined by 99,000.

In January, employment in both wholesale and retail trade was little changed. Within retail trade, employment in food and beverage stores was up by 12,000 over the month.

# Weekly Hours (Establishment Survey Data)

In January, the average workweek for production and nonsupervisory workers on private nonfarm payrolls fell by 0.1 hour to 33.7 hours, seasonally adjusted. The manufacturing workweek was unchanged at 41.1 hours, and factory overtime was unchanged at 4.0 hours. (See table B-2.)

The index of aggregate weekly hours of production and nonsupervisory workers on nonfarm payrolls declined by 0.3 percent in January to 107.5 (2002=100). The manufacturing index was unchanged at 93.7. (See table B-5.)

# Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of production and nonsupervisory workers on private nonfarm payrolls rose by 4 cents, or 0.2 percent, in January to \$17.75, seasonally adjusted. This followed a gain of 7 cents in December. Average weekly earnings fell by 0.1 percent in January to \$598.18. Over the year, average hourly earnings rose by 3.7 percent, and weekly earnings rose by 3.4 percent. (See table B-3.)

The Employment Situation for February 2008 is scheduled to be released on Friday, March 7, at 8:30 A.M. (EST).

# **Revisions to Establishment Survey Data**

In accordance with annual practice, the establishment survey data have been revised to reflect comprehensive universe counts of payroll jobs, or benchmarks. These counts are derived principally from unemployment insurance tax records for March 2007. In addition, establishment survey data were updated to the 2007 North American Industry Classification System (NAICS) from the 2002 NAICS basis; this resulted in minor changes to several detailed industry series. Not seasonally adjusted data series affected by the NAICS 2007 update were subject to revision from January 1990 forward. All other not seasonally adjusted data series were subject to revision from April 2006 forward, the time period since the last benchmark was established. In addition, with this release, the seasonally adjusted establishment survey data from January 1990 forward were subject to revision due to the introduction of updated seasonal adjustment factors and NAICS 2007 updates.

Table B presents revised total nonfarm employment data on a seasonally adjusted basis for January through December 2007. The revised data for April 2007 forward incorporate the effect of applying the rate of change measured by the sample to the new benchmark level, as well as updated net business birth/death model adjustments and new seasonal adjustment factors. The November and December 2007 revisions also reflect the routine incorporation of additional sample receipts into the November final and December second preliminary estimates. The total nonfarm employment level for March 2007 was revised downward by 293,000 (284,000 on a seasonally adjusted basis). The previously published level for December 2007 was revised downward by 256,000 (376,000 on a seasonally adjusted basis).

An article that discusses the benchmark and post-benchmark revisions, as well as all revised historical Current Employment Statistics (CES) data, can be accessed through the CES homepage at http://www.bls.gov/ces/. Information on the revisions released today also may be obtained by calling (202) 691-6555.

Table B. Revisions in total nonfarm employment, January-December 2007, seasonally adjusted

(In thousands)

	Le	evels	Over-	the-month c	hanges
Year and month	As previously published	As revised	As previously published	As revised	Difference

# Adjustments to Population Estimates for the Household Survey

Effective with data for January 2008, updated population controls have been used in the household survey. Population controls for the household survey are developed by the U.S. Census Bureau. Each year, the Census Bureau updates the controls to reflect new information and assumptions about the growth of the population during the decade. The change in population reflected in the new controls results primarily from adjustments to the estimates of net international migration and the institutional population, along with updated vital statistics information.

As per usual practice, BLS will not revise the official household survey estimates for December 2007 and earlier months. To show the impact of the updated population controls, however, some December 2007 estimates were recalculated using the new controls. The differences in selected December estimates based on the old and new controls are shown in table C. The new controls decreased the estimated size of the civilian noninstitutional population in December by 745,000, the civilian labor force by 637,000, and employment by 598,000; the new population controls had a negligible impact on unemployment rates and other percentage estimates. Table D shows the effect of the introduction of new population controls on the over-the-month changes between December 2007 and January 2008. More detailed information on the population adjustments and their effect on national labor force estimates are available at http://www.bls.gov/cps/cps08adj.pdf on the Internet.

Table C. Effect of the revised population controls on December 2007 estimates by sex, race, and Hispanic or Latino ethnicity, not seasonally adjusted

(Numbers in thousands)

Category	Total	Men	Women	White	Black or African Ameri- can	Asian	Hispanic or Latino ethnicity
Civilian noninstitutional population	-745	-467	-278	-436	-101	-176	-349
Civilian labor force	-637	-422	-216	-404	-83	-126	-270
Employed	-598	-394	-204	-379	-75	-121	-252
Unemployed	-40	-28	-12	-25	-8	-4	-18
Unemployment rate	.0	.0	.0	.0	.0	.0	.0

NOTE: Detail for men and women may not sum to totals because of rounding. Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

Table D. Effect of the revised population controls on the December 2007-January 2008 over-the-month changes in selected labor force measures

(Numbers in thousands)

Civilian noninstitutional population  Civilian labor force  Participation rate  Employed  Employment-population ratio  Unemployed  Unemployed  Unemployment rate	-42 .1 37 .2 -79	-745 -637 1 -598 1 -40	205 595 .2 635 .3 -39

<sup>&</sup>lt;sup>1</sup> Differences are calculated from unrounded estimates.

# Frequently Asked Questions about Employment and Unemployment Estimates

# Why are there two monthly measures of employment?

The household survey and establishment survey both produce sample-based estimates of employment and both have strengths and limitations. The establishment survey employment series has a smaller margin of error on the measurement of month-to-month change than the household survey because of its much larger sample size. An over-the-month employment change of 104,000 is statistically significant in the establishment survey, while the threshold for a statistically significant change in the household survey is about 400,000. However, the household survey has a more expansive scope than the establishment survey because it includes the self-employed, unpaid family workers, agricultural workers, and private household workers, who are excluded by the establishment survey. The household survey also provides estimates of employment for demographic groups.

# Are undocumented immigrants counted in the surveys?

Neither the establishment nor household survey is designed to identify the legal status of workers. Thus, while it is likely that both surveys include at least some undocumented immigrants, it is not possible to determine how many are counted in either survey. The household survey does include questions about whether respondents were born outside the United States. Data from these questions show that foreign-born workers accounted for about 15 percent of the labor force in 2006 and about 47 percent of the net increase in the labor force from 2000 to 2006.

## Why does the establishment survey have revisions?

The establishment survey revises published estimates to improve its data series by incorporating additional information that was not available at the time of the initial publication of the estimates. The establishment survey revises its initial monthly estimates twice, in the immediately succeeding 2 months, to incorporate additional sample receipts from respondents in the survey. For more information on the monthly revisions, please visit http://www.bls.gov/ces/cesrevinfo.htm.

On an annual basis, the establishment survey incorporates a benchmark revision that re-anchors estimates to nearly complete employment counts available from unemployment insurance tax records. The benchmark helps to control for sampling and modeling errors in the estimates. For more information on the annual benchmark revision, please visit http://www.bls.gov/web/cesbmart.htm.

# Has the establishment survey understated employment growth because it excludes the selfemployed?

While the establishment survey excludes the self-employed, the household survey provides monthly estimates of unincorporated self-employment. These estimates have shown no substantial growth in recent years.

# Does the establishment survey sample include small firms?

Yes; about 40 percent of the establishment survey sample is comprised of business establishments with fewer than 20 employees. The establishment survey sample is designed to maximize the reliability of the total nonfarm employment estimate; firms from all size classes and industries are appropriately sampled to achieve that goal.

# Does the establishment survey account for employment from new businesses?

Yes; monthly establishment survey estimates include an adjustment to account for the net employment change generated by business births and deaths. The adjustment comes from an econometric model that forecasts the monthly net jobs impact of business births and deaths based on the actual past values of the net impact that can be observed with a lag from the Quarterly Census of Employment and Wages. The establishment survey uses modeling rather than sampling for this purpose because the survey is not immediately able to bring new businesses into the sample. There is an unavoidable lag between the birth of a new firm and its appearance on the sampling frame and availability for selection. BLS adds new businesses to the survey twice a year.

# Is the count of unemployed persons limited to just those people receiving unemployment insurance benefits?

No; the estimate of unemployment is based on a monthly sample survey of households. All persons who are without jobs and are actively seeking and available to work are included among the unemployed. (People on temporary layoff are included even if they do not actively seek work.) There is no requirement or question relating to unemployment insurance benefits in the monthly survey.

## Does the official unemployment rate exclude people who have stopped looking for work?

Yes; however, there are separate estimates of persons outside the labor force who want a job, including those who have stopped looking because they believe no jobs are available (discouraged workers). In addition, alternative measures of labor underutilization (discouraged workers and other groups not officially counted as unemployed) are published each month in the Employment Situation news release.

# **Technical Note**

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with state agencies. The sample includes about 160,000 businesses and government agencies covering approximately 400,000 individual worksites. The active sample includes about one-third of all nonfarm payroll workers. The sample is drawn from a sampling frame of unemployment insurance tax accounts.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

# Coverage, definitions, and differences between surveys

**Household survey**. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as *employed* if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as *unemployed* if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4-week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The *civilian labor force* is the sum of employed and unemployed persons. Those not classified as employed or unemployed are *not in the labor force*. The *unemployment rate* is the number unemployed as a percent of the labor force. The *labor force participation rate* is the labor force as a percent of the population, and the *employment-population ratio* is the employed as a percent of the population.

**Establishment survey.** The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as federal, state, and local government entities. *Employees on nonfarm payrolls* are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. *Hours and earnings* data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-providing sector. Industries are classified on the basis of their principal activity in accordance with the 2002 version of the North American Industry Classification System.

**Differences in employment estimates**. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:

- The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
- The household survey includes people on unpaid leave among the employed. The establishment survey does not.
- The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
- The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

#### Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Most seasonally adjusted series are independently adjusted in both the household and establishment surveys. However, the adjusted series for many major estimates, such as total payroll employment, employment in most supersectors, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major age-sex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

For both the household and establishment surveys, a concurrent seasonal adjustment methodology is used in which new seasonal factors are calculated each month, using all relevant data, up to and including the data for the current month. In the household survey, new seasonal factors are used to adjust only the current month's data. In the establishment survey, however, new seasonal factors are used each month to adjust the three most recent monthly estimates. In both surveys, revisions to historical data are made once a year.

#### Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or *sampling error*, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 430,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90-percent confidence interval on the monthly change would range from -330,000 to 530,000  $(100,000 \pm 430,000)$ . These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90-percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a 90-percent chance) that an employment rise had, in fact, occurred. At an unemployment rate of around 5.5 percent, the 90-percent confidence interval for the monthly change in unemployment is about +/- 280,000, and for the monthly change in the unemployment rate it is about +/- .19 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by *nonsampling error*. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth, an estimation procedure with two components is used to account for business births. The first component uses business deaths to impute employment for business births. This is incorporated into the sample-based link relative estimate procedure by simply not reflecting sample units going out of business, but imputing to them the same trend as the other firms in the sample. The second component is an ARIMA time series model designed to estimate the residual net birth/death employment not accounted for by the imputation. The historical time series used to create and test the ARIMA model was derived from the unemployment insurance universe micro-level database, and reflects the actual residual net of births and deaths over the past five years.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.2 percent, ranging from less than 0.05 percent to 0.4 percent.

2 Not seasonally adjusted.

work part time (less than 35 hours per week) or are on layoff from part-time jobs. NOTE: Detail for the seasonally adjusted data shown in this table will not

necessarily add to totals because of the independent seasonal adjustment of the various series. Updated population controls are introduced annually with the release of January data.

Full-time workers are unemployed persons who have expressed a desire to work full time (35 hours or more per week) or are on layoff from full-time jobs.

4 Part-time workers are unemployed persons who have expressed a desire to

<sup>&</sup>lt;sup>1</sup> Persons with no previous work experience are included in the unemployed total.

NOTE: Updated population controls are introduced annually with the release of January data.

Table A-12. Alternative measures of labor underutilization

(Percent)

Measure	Not sea	isonally a	djusted	Seasonally adjusted						
	Jan. 2007	Dec. 2007	Jan. 2008	Jan. 2007	Sept. 2007	Oct. 2007	Nov. 2007	Dec. 2007	Jan. 2008	
U-1 Persons unemployed 15 weeks or longer, as a percent of the civilian labor force	1.5	1.6	1.7	1.4	1.6	1.5	1.6	1.6	1.6	
U-2 Job losers and persons who completed temporary jobs, as a percent of the civilian labor force	2.7	2.6	3.0	2.2	2.4	2.4	2.3	2.5	2.5	
U-3 Total unemployed, as a percent of the civilian labor force (official unemployment rate)	5.0	4.8	5.4	4.6	4.7	4.8	4.7	5.0	4.9	
U-4 Total unemployed plus discouraged workers, as a percent of the civilian labor force plus discouraged workers	5.3	5.0	5.7	4.9	4.9	5.0	4.9	5.2	5.2	
U-5 Total unemployed, plus discouraged workers, plus all other marginally attached workers, as a percent of the civilian labor force plus all marginally attached workers	6.0	5.6	6.4	5.6	5.5	5.6	5.5	5.8	6.0	
U-6 Total unemployed, plus all marginally attached workers, plus total employed part time for economic reasons, as a percent of the civilian labor force plus all marginally attached workers	9.1	8.7	9.9	8.3	8.4	8.4	8.4	8.8	9.0	

NOTE: Marginally attached workers are persons who currently are neither working nor looking for work but indicate that they want and are available for a job and have looked for work sometime in the recent past. Discouraged workers, a subset of the marginally attached, have given a job-market related reason for not looking currently for a job. Persons employed part time for economic reasons are

those who want and are available for full-time work but have had to settle for a part-time schedule. For more information, see "BLS introduces new range of alternative unemployment measures," in the October 1995 issue of the Monthly Labor Review. Updated population controls are introduced annually with the release of January data.
