Imputation and Allocation of CE Data

Clayton Knappenberger Economist Division of Consumer Expenditure Surveys 2018 CE Microdata Users' Workshop July 20

Outline

- 1. Process Overview
- 2. Imputation
- 3. Allocation
- 4. Edit Rates and Conclusion

Process Overview

CE's goal is to map expenditures

- As monthly amounts
- ► To specific Universal Classification Codes (UCCs)
- In a specific month and year
- However, collected data are often insufficient
 - Collected information has mistakes
 - Respondent does not know or refuses to provide

Process Overview

- 1. Data Screening check data for errors
- 2. Impute missing values
- **3. Allocate** combined expenditures to components for mapping.
- 4. Mapping expenditures to months and UCCs (as well as higher level aggregations)

Data Screening

Misclassifications

- Specific keyword lookups for "hard to classify" items
 - iPad/iPhone/iPod
 - "Glasses"/"Cable"/"Nails"
- General text analysis of item descriptions
- Updates are made based on the reported item description and any interviewer notes

Outlier Review

- Three methods:
 - Largest Gap biggest gap between records above the mean
 - 2. P-Index value divided by gap minimum
 - 3. Z-Score value divided by IQR
- Updates are made by:
 - 1. Correcting values with available information
 - 2. Flag the expenditure for imputation

Imputation

- 1. Weighted Mean Imputation
- 2. Hot Deck Imputation
 - Use valid records with similar characteristics to replace missing values
- 3. Percent Distribution Imputation
 - Randomly select a valid value based on the percent distribution of reported values

8 — U.S. Bureau of Labor Statistics ${\scriptstyle \bullet}$ dis.gov

Weighted Mean Imputation

- Use valid records with similar characteristics to define cells
- Calculate the weighted mean of that cell
- Assign the weighted mean of reported expenditures within a given cell to missing or invalid expenditures in the same cell

Hot Deck Imputation Example

- A respondent reports buying a men's jacket, but does not know the cost
- Imputation steps:
 - Select a valid random men's jacket expenditure from all such purchases with the same:
 - Region
 - Area Type
 - Income Class
 - The selected record's expenditure amount is copied to the record being imputed

Percent Distribution

A respondent does not say how many people are covered by an insurance plan

11 — U.S. BUREAU OF LABOR STATISTICS • bis.gov

<u>Steps</u>

- 1. Create CDF
- 2. Get Random Number
- 3. Assign value

Allocation

- Example: Respondent reported spending \$500 on clothing
- We need two pieces of information:
 - 1. Targets shirts, pants, and shoes
 - 2. Allocation Proportions
 - 45% on shirts
 - 35% on pants
 - 20% on shoes

Picking the Target Items

Allocating the amounts

- 1. Get the weighted means for each item selected
- 2. Calculate the share of the sum of the means
- 3. Derive allocation amounts

Item	Mean (\$)	Share (%)	Allocation (\$)
Shirts	\$35.00	21.88%	\$109.40
Pants	\$67.00	41.87%	\$209.35
Shoes	\$58.00	36.25%	\$181.25
Total	\$160.00	100.00%	\$500.00

Imputation and Allocation Rates

Why Impute and Allocate?

Benefits

- Meet internal needs for mapping
- Provide complete datasets to users

Concerns

- Our methods rely on MAR assumption
- Potential for underestimated variance
