

Comparative Civilian Labor Force Statistics, 10 Countries, 1960-2004

In November 2005, data for France, Germany, and the United Kingdom were revised through 2004 and released to the public. These data are available on the Foreign Labor Statistics website at <http://www.bls.gov/fls/home.htm>, in the section "Get Detailed FLS Statistics." Data for these three countries no longer correspond to the data shown in this report. The next complete update is scheduled for Spring 2006.

Monthly updates to unemployment rates are available on the Foreign Labor Statistics website at <http://www.bls.gov/fls/home.htm>, in the section "Labor Force, Employment, and Unemployment--International Statistics."

Spring 2005. This report has been reformatted. Table 2 in previous reports is now divided into tables 2 and 3. Table 9 in previous reports now appears as table B on page 4 of the General Notes. Data for 1959 have been omitted so that all historical series now begin with 1960.

GENERAL NOTES

This document presents selected international labor force statistics for 10 countries: the United States, Canada, Australia, Japan, and 6 European countries. The data are adjusted to approximate U.S. concepts except for the data in table 3, which are published by the originating country.

ADJUSTMENTS

The U.S. concepts that form the basis of the international comparisons are described below.

- Civilian noninstitutional working age population. Included are persons 16 years of age and older who are not inmates of institutions and who are not on active duty in the Armed Forces.
- Employed persons. All persons who, during the reference week, (a) did any work at all (at least 1 hour) as paid employees, worked in their own business, profession, or on their own farm, or worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family, and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of vacation, illness, bad weather, childcare problems, maternity or paternity leave, labor-management dispute, job training, or other family or personal reasons, whether or not they were paid for the time off or were seeking other jobs.
- Unemployed persons. All persons who had no employment during the reference week, were available for work, except for temporary illness, and actively seeking work during the 4-week period ending with the reference week. Persons who were waiting to be recalled to a job from which they had been laid off need not have been looking for work to be classified as unemployed.

For more detail of U.S. concepts, see the Bureau of Labor Statistics *Handbook of Methods*, Chapter 1, "Labor force data derived from the Current Population Survey," on the Internet at <http://www.bls.gov/opub/hom/homtoc.htm>.

The foreign country data are adjusted as closely as possible to U.S. concepts with the exception of lower age limits and the treatment of layoffs. Lower age limits are adjusted to the age at which compulsory schooling ends, rather than the U.S. lower age limit of 16 (see Population Coverage section for exceptions). In the United States, persons on layoff are classified as unemployed because of weak job attachment; however, in some countries, persons on layoff are classified as employed because of strong job attachment. In addition, for some countries, no adjustment is made for deviations from U.S. concepts in the treatment of unpaid family workers, persons waiting to start a new job, and passive jobseekers. In the United States, job search must be "active," such as placing or answering advertisements; simply reading ads is not enough to qualify as active job search. Canada and the European countries classify passive jobseekers as unemployed. An adjustment is made to exclude them in Canada, but not in the European countries, where the phenomenon is much less prevalent. Australia and Japan exclude passive jobseekers, in accordance with the U.S. concept. These "unadjusted" differences have a negligible effect on the comparisons. For further information on comparability issues, see Constance Sorrentino, "International unemployment rates: how comparable are they?" *Monthly Labor Review*, June 2000, pp. 3-20, on the Internet at <http://www.bls.gov/opub/mlr/2000/06/art1full.pdf>.

For most countries, the adjusted unemployment rates are close to or identical with the published rates in recent years. However, there were greater differences historically. Significant differences remain for three countries: Canada, Germany, and Sweden. The Country Notes section explains the adjustments made.

BREAKS IN SERIES

Various changes, such as changes in national data sources and BLS adjustment methods, created breaks in the historical continuity of series for all countries except Japan. An asterisk * appears next to the data point where there is a break in series. Some breaks are inconsequential, while others represent a significant discontinuity in the series. The Country Notes section explains the more recent breaks in series and measures their impact, where overlapping data are available.

POPULATION COVERAGE

Data refer to the civilian noninstitutional working age population except in Japan and Germany, where the institutional population is included. The lower age limit for the United States is 16. The lower age limits for the other countries vary over years within a country, across countries, and between published data and data adjusted to U.S. concepts. The data are adjusted to the age at which compulsory schooling ends in each country, except for Canada and the Netherlands. For Canada for 1976 onward, data are adjusted to cover persons ages 16 and over, whereas the age at which compulsory schooling ends remains at 15. For the Netherlands, from 1975 onward, data are adjusted to cover persons ages 15 and over, whereas the age at which compulsory full-time schooling ends is now 16. See table A below for lower age limits by country for published and adjusted statistics.

Table A. Lower Age Limits for the Published and Adjusted Statistics

Country	Published	Adjusted	Country	Published	Adjusted
United States	16	16			
Canada			Italy		
1960-65	14	15	1960-92	14	14
1966-75	15	15	1993-present	15	15
1976-present	15	16	Netherlands		
Australia	15	15	1973-74	13	14
Japan	15	15	1975-87	14	15
France			1988-present	15	15
1960-67	14	16	Sweden	16	16
1968-present	15	16	United Kingdom		
Germany			1960-72	15	15
1960-74	14	15	1973-present	16	16
1975-83	14/15	15			
1984-present	15	15			

NAICS

The employment data by sector (tables 6 and 7) for the United States and Canada are classified using the North American Industry Classification System (NAICS). The federal statistical agencies of the United States, Canada, and Mexico developed NAICS. This new classification provides better comparability in statistics for business activity across North America. Employment data by sector for 2000 forward for the United States and for 1976 forward for Canada are shown based on the 2002 NAICS. Employment data by sector for all other countries in this report are shown based on the International Standard Industrial Classification.

OTHER COMPARATIVE SERIES

Three organizations compile internationally comparable monthly and annual series of unemployment rates for selected countries:

- The BLS publishes unemployment rates adjusted to U.S. concepts, as shown in this compendium.
- The Organization for Economic Cooperation and Development (OECD) publishes "Standardized Unemployment Rates" (SURS) for 27 member countries.¹ The SURS are adjusted to International Labor Office (ILO) concepts, which are more general than U.S. concepts.
- The Statistical Office of the European Communities (EUROSTAT) publishes comparable unemployment rates for European Union countries based on their own interpretation of ILO concepts. Since 1992,² EUROSTAT concepts are close to U.S. concepts, but some differences remain.

In 1996, the OECD adopted the comparable unemployment rates produced by EUROSTAT for the European Union countries and revised its historical series to be in accord with EUROSTAT. Therefore, the OECD SURS are now identical to the EUROSTAT standardized unemployment rates for the European Union countries. Monthly updates to the SURS are available on the Internet at <http://www.oecd.org/statistics/news-releases>. The following table compares the unemployment rates published by BLS and those published by OECD and EUROSTAT for the most recent three years.

¹ See OECD, *Quarterly Labor Force Statistics*, Appendix section.

² 1993 for Italy.

Table B. BLS and OECD Comparative Civilian Unemployment Rates, 2002-04

Year	United States	Canada	Australia	Japan	France	Germany	Italy	Netherlands	Sweden	United Kingdom
BLS Series (Approximating U.S. Concepts)										
2002	5.8	7.0	6.4	5.4	9.0	8.7	8.7	2.7	5.1	5.2
2003	6.0	6.9	6.1	5.3	9.6	9.7	8.5	3.8	5.8	5.0
2004	5.5	6.4	5.5	4.8	9.8	9.8	8.1	4.7	6.6	4.8
OECD SURS (1)										
2002	5.8	7.7	6.4	5.4	8.9	8.2	8.6	2.7	4.9	5.1
2003	6.0	7.6	6.1	5.3	9.5	9.1	8.4	3.8	5.6	5.0
2004	5.5	7.2	5.5	4.7	9.6	9.5	8.0	4.7	6.4	4.6

(1) For the European Union countries, the denominator of the rate excludes conscripts but includes career military residing in private households.

ACKNOWLEDGMENT

The sources of data in this compendium of labor statistics are primarily national statistical sources, as well as the OECD and EUROSTAT.

COUNTRY NOTES

The following notes by country describe adjustments made to unemployment rates and the impact of breaks in series.

UNITED STATES

Published unemployment rates are from a monthly labor force survey, the Current Population Survey (CPS).

Adjustments. None.

Breaks. While current survey concepts and methods are very similar to those introduced at the inception of the CPS in 1940, several changes have been made over the years to improve the accuracy and usefulness of the data. These methodological changes and others, such as the introduction of new population controls from the decennial censuses, can affect historical comparability. Most changes had small effects on historical comparability. Although also small in impact, the 1990 and 1994 breaks reflect major changes in methodology, and they are described below.

In 1994, a major redesign of the labor force survey questionnaire and collection methodology was introduced. Revised population estimates based on the 1990 Census and adjusted for the estimated undercount were also incorporated for data from 1990 onward. Therefore, data for 1994 onward are not strictly comparable with data for 1993 and earlier years because of the redesign, and data for 1990 onward are not strictly comparable with data for 1989 and earlier years because of the introduction of the 1990 census-based population controls. The introduction of the population controls increased the 1990 employment by 879,000 and increased the overall unemployment rate by 0.1 percentage point. There was no effect on the female participation rate or the female employment-population ratio for 1990. The redesign effect on employment cannot be precisely determined, but it raised the overall unemployment rate by 0.1 percentage point.

For a description of all the changes in the CPS over time and their impact, see Historical Comparability in the "Household Data" section of the BLS publication, *Employment and Earnings*, on the Internet at http://www.bls.gov/cps/eetech_methods.pdf.

Employment data by sector (tables 6 and 7) from 2000 forward are shown on the 2002 NAICS. Before 2000, the data are shown on the 1987 Standard Industrial Classification (SIC) basis. For 2000-02, the change from the 1987 SIC basis to the NAICS 2002 basis decreased employment in all sectors except services. In 2000, on the 1987 SIC basis, agriculture represented 2.6 percent of all civilian employment; industry, 22.2 percent; manufacturing (a subsector of industry), 14.8

percent; and services, 75.2 percent. In 2000, on the 2002 NAICS basis, agriculture represented 1.8 percent of all civilian employment; industry, 22.0 percent; manufacturing, 14.4 percent; and services, 76.2 percent.

CANADA

Published unemployment rates are from a monthly labor force survey.

Adjustments. For 1976 onward, five adjustments are made:

- 15 year olds are excluded.
- Passive jobseekers are excluded.
- Persons waiting to start a new job who did not seek work in the past four weeks are excluded.
- Persons unavailable for work due to personal or family responsibilities are excluded.
- Full-time students looking for full-time work are included.

The adjustments lowered the annual average unemployment rate by 0.1-0.4 percentage point in the 1980s, by 0.4-1.0 percentage point in the 1990s, and by 0.7-0.8 percentage point in the 2000s. Statistics Canada provides BLS with the Canadian unemployment rates adjusted to U.S. concepts for 1976 onward. For further information, see Constance Sorrentino, "International unemployment rates: how comparable are they?" *Monthly Labor Review*, June 2000, pp. 3-20, on the Internet at <http://www.bls.gov/opub/mlr/2000/06/art1full.pdf>.

Breaks. The 1966 break in the published series reflects a change in the definition of the labor force. In 1976, there are breaks in both the published and adjusted series. Beginning in 1976, Canadian data are adjusted to more closely approximate U.S. concepts, as described above. In addition, figures are revised after census population estimates become available. Canadian data were last benchmarked to the 2001 census population counts, for 1976 onward.

Employment data by sector (tables 6 and 7) for 1976 forward are shown on the 2002 NAICS. These data are also benchmarked to the 2001 Census population counts. Data prior to 1976 are shown on the Canadian SIC. A comparison between NAICS 2002 and the Canadian SIC of the employment distribution in manufacturing for 1998 shows that manufacturing is 15.7 percent of total employment on the SIC basis and 15 percent on the NAICS basis.

AUSTRALIA

Published unemployment rates are from a labor force survey that began as a quarterly survey in 1964 and became monthly in 1978.

Adjustments. No adjustments are made. The Australian unemployment rate is virtually unchanged when U.S. concepts are applied.

Breaks. A redesigned labor force survey questionnaire was introduced in April 2001 that allowed for a closer application of ILO guidelines. Australia revised the data back to April 1986 based on the 2001 changes, creating a break in series in 1986 for both the published and adjusted series. The redesign lowered the unemployment rate by 0.2 percentage point for 1986. A reclassification of persons waiting to start a new job from "not in the labor force" to "unemployed" could only be incorporated for April 2001 forward, creating a small break in the unemployment series. The reclassification increased the adjusted unemployment rate by 0.1 percentage point in 2001.

The 1964 break in the published and adjusted unemployment rates reflects a change in source. The Australian labor force survey was initiated in 1964. Unemployment rates for 1960-63 were estimated by an Australian researcher.

JAPAN

Published unemployment rates are from a monthly labor force survey.

Adjustments. Two adjustments are made in the Japanese labor force data:

- Family workers who worked less than 15 hours per week are excluded.
- The National Defense Force is excluded.

The number of unemployed is not adjusted. The adjustments made result in unemployment rates that are virtually the same as the published rates.

Unemployment rates by sex (table 8) for 1994-2000 are from Toshihiko Yamagami, "Underutilization of labor resources in Japan and the United States," *Monthly Labor Review*, April 2002, pp. 25-43, on the Internet at <http://www.bls.gov/opub/mlr/2002/04/art3full.pdf>. Rates for 2001-04 were updated and provided to BLS by Mr. Yamagami.

Mr. Yamagami uses special tabulations from the Special Survey of the Labor Force Survey, which has more detailed information on job search.

Breaks. None.

FRANCE

Published unemployment rates are estimates of unemployment under ILO concepts based on a combination of sources, including monthly employment office registrations, quarterly establishment surveys, and a labor force survey that was annual and is now continuous.

Adjustments. Adjusted data are based on labor force survey statistics. Two adjustments are made in the French labor force data:

- Persons under age 16 are excluded prior to 1992. From 1992 onward, the number of employed under age 16 had virtually no impact on the unemployment rate so this adjustment is no longer made.
- The Armed Forces is excluded.

Breaks. The 1982 break in the adjusted employment and unemployment series reflects the introduction of a new questionnaire and the implementation of definitions recommended by the ILO. France incorporated the 1999 population census results for 1990 forward, creating a break in series in 1990. Furthermore, for 1990 onward, BLS adjustment methods for unemployment are revised: The labor force survey results from OECD were replaced with those from EUROSTAT, whose definitions are closer to U.S. concepts. The EUROSTAT source showed a lower unemployment rate by 0.5 percentage point in 1990.

For the published employment and unemployment series, there are breaks in 1968 and 2001. The 1968 break reflects a change in the source for published data. For 1968 forward, employment data are based on the French statistical institute (Institut National de la Statistique et des Etudes Economiques, or INSEE) data; unemployment data are based on the INSEE series using ILO concepts. Prior to 1968, published employment and unemployment data are from the OECD. The 2001 break reflects an improvement in INSEE's estimation method.

GERMANY

Published unemployment rates are based on a combination of sources, including the registered unemployed and employment data from an establishment survey. From 1991 onward, the labor force is calculated as all civilian employed plus the registered unemployed. Prior to 1991, for former West Germany, the labor force is calculated as civilian employed wage and salary workers plus the registered unemployed.

Adjustments. Adjusted data are based on labor force survey statistics. Two adjustments are made in the German labor force survey data:

- Prior to 1991, family workers who worked less than 15 hours per week were excluded.
- The career military is excluded.

Breaks. The 1983 break in the adjusted series reflects a change in data source from the Microcensus, the German labor force survey, to the EUROSTAT labor force survey. This change lowered the adjusted unemployment rate in 1983 by 0.3 percentage point, from 7.2 to 6.9 percent. The 1991 break reflects the introduction of comparative labor force measures for Germany (unified). Data for years prior to 1991 relate to former West Germany. In 1991, the adjusted unemployment rate was revised from 4.3 to 5.6 percent because of the inclusion of former East Germany. The 1999 break reflects the incorporation of an improved method of data calculation and a change in coverage to persons living in private households only. There is a break in the published unemployment rate series in 1991 as noted above.

The German Statistical Office did not revise employment data by sector for the years 1971-79. Consequently, data for Germany for these years in tables 6 and 7 are not available.

ITALY

Published unemployment rates are from a continuous labor force survey that was quarterly before 2004.

Adjustments. Adjusted data are based on labor force survey statistics. Although these data are closely comparable in definitions with U.S. data in recent years, two adjustments are made:

- The career military is excluded.
- Unpaid family workers working less than 15 hours per week are excluded.

Breaks. The 1986 break reflects a change in the survey questionnaire resulting in a significant increase in the number of people reported as seeking work in the past 30 days. This change raised the Italian unemployment rate approximating U.S. concepts by 1.2 percentage points in 1986, from 6.3 to 7.5 percent. In 1991, the method of weighting sample data was revised. The impact was an increase in the adjusted unemployment rate by approximately 0.3 percentage point, from 6.6 to 6.9 percent in 1991.

In October 1992, the Italian statistical institute (Istituto Nazionale di Statistica, or ISTAT) revised its survey methodology, changed coverage to exclude 14 year olds, and restricted the definition of unemployment to include only those who were actively looking for a job within the 30 days preceding the reference period and who were available for work. In 2004, the survey was redesigned to be a continuous labor force survey and to more closely follow ILO and EUROSTAT recommendations. Data were revised back to October 1992. BLS adjustment methods have varied to incorporate these changes. BLS incorporates the October 1992 revisions for 1993 onward. The unemployment rate in 1993 is about half a percentage point higher than the unemployment rate prior to all of these revisions.

NETHERLANDS

Published unemployment rates are based on a combination of sources, including the registered unemployed, wage and salary workers (from an establishment survey), and a labor force survey that has varied from annual to quarterly to monthly.

Adjustments. Adjusted data are based on labor force survey statistics. For 1983 onward, the annual average of registered unemployed is adjusted to U.S. concepts on the basis of the European Community labor force survey, as annualized by EUROSTAT. Prior to 1983, the adjustment method is based on the results of the then-biennial Dutch labor force survey. For all years, two adjustments are made:

- The career military is excluded.
- Unpaid family workers working less than 15 hours per week are excluded.

No adjustment is made for the age at which compulsory schooling ends. In the 1990's, the compulsory school age limit was raised. Young persons must attend school full time until they are age 16 and part time until the end of the school year in which they reach age 17.

Over the years, adjusted rates have varied from higher than to lower than the published rates. More substantial adjustments were made in the earlier years. During the last few years, adjusted and published rates are very close.

Breaks. The 1983 break reflects a change in sources. Labor force data from the national statistical office were replaced with EUROSTAT data. Employment figures based on man-year employment data were replaced with data from the Dutch Survey of Employed Persons. The impact of the changes was a decrease in the adjusted unemployment rate by about 2 percentage points in 1983. The 1988 break is due to the introduction of a new survey questionnaire in 1992 that allowed for a closer application of ILO guidelines. EUROSTAT revised the Dutch series back to 1988. The 1988 revised unemployment rate is 7.2 percent; the previous figure for 1988 was 9.3 percent.

There are two breaks in series for published employment. The 1987 break reflects the introduction of a continuous labor force survey, which began that year. The 1992 break reflects changes in the labor force survey definitions. There are also two breaks in series for published unemployment. The 1975 break reflects a change in the enumeration of the registered unemployed. The 1988 break reflects the incorporation of data from the labor force survey with data on the registered unemployed from the public employment offices.

SWEDEN

Published unemployment rates are based on a labor force survey that began as a quarterly survey in 1961, became monthly in 1970, and continuous in 1993.

Adjustments. Adjusted data are based on labor force survey statistics. For 1987 forward, an adjustment is made to include full-time students seeking work and available for work who are counted as not in the labor force in Sweden. In addition, two adjustments are made to the labor force for all years:

- The career military is excluded.
- Persons age 65 and over are included.

Sweden imposes an upper age limit of 64 (prior to 1986, the upper age limit was 74). BLS makes adjustments to include persons 65 and over for all series except for employment data by sector (tables 6 and 7). The upper age limit for sector data is 74 for all years.

Breaks. The 1986 break in the published series is due to a change in population coverage from 16-74 years to 16-64 years. The 1987 break in all series is due to the introduction of a new questionnaire in the Swedish labor force survey. Questions regarding current availability were added and the period of active work-seeking was reduced from 60 days to 4 weeks. These changes lowered Sweden's 1987 unemployment rate by 0.4 percentage point. In 1993, Sweden implemented a new reference week system to cover all 52 weeks of the year rather than one week each month and introduced new estimation procedures. These changes were taken back to 1987 onward and had the effect of raising the unemployment rate between 0.2 and 0.5 percentage point for the years prior to 1993.

Beginning in 1987, BLS adjusts the Swedish data to classify students who also sought work as unemployed. The adjustment raised the unemployment rate by 0.1 percentage point in 1987 and by 1.8 percentage points in 1994, when unemployment was higher. In 2004, the national unemployment rate was adjusted from 5.5 to 6.6 percent because of the inclusion of students.

The net effect of the 1987 and 1993 changes and the BLS adjustment for students seeking work lowered Sweden's 1987 unemployment rate from 2.3 to 2.2 percent.

UNITED KINGDOM

For 1971 onward, published unemployment rates are based on a labor force survey that was biennial for 1979-83, annual for 1984-91, and continuous for 1992 onward, as well as Office for National Statistics (ONS) estimates. Prior to 1971, published unemployment rates are based on statistics of monthly claimants for unemployment benefits, calculated as a percent of the total labor force.

Adjustments. Adjusted data are based on labor force survey statistics from 1971 onward, and for prior years, on population census and sample census statistics in combination with other sources. For 1971 onward, the only adjustment made is to exclude the career military.

Breaks. The 1971 break is due to the introduction by ONS of a new historical series for 1971-91. This series is now consistent with the series for 1992 and later years; data for 1971 onward now comply with the current ILO definition of unemployment. Also, the definition of employment includes unpaid family workers. ONS adjusted the data for discontinuities in the existing pre-1992 Labor Force Survey series. ONS estimates are based on a combination of labor force survey data and administrative data. For the detailed methodology underlying the estimates, see Paul Doyle, "Consistent Historical Time Series of Labour Market Data," on the Internet at http://www.statistics.gov.uk/articles/labour_market_trends/Consistent_Time_Series_web_article.pdf.

Table 1. Civilian Working Age Population Approximating U.S. Concepts, 1960-2004 (in thousands)

Year	United States	Canada	Australia	Japan	France	Germany	Italy	Netherlands	Sweden	United Kingdom

Table 3. Civilian Labor Force, Employment, and Unemployment Published by Originating Country, 1960-2004--Continued

Footnotes:

NA = Not available.

* Indicates a break in series. See section on breaks in the Country Notes on pages 4-8 for more information.

(1) Published data are identical to data approximating U.S. concepts shown in table 2 for all years for the United States and Australia and for 1966 to 1975 for Canada.

(2) Including military personnel for Japan, Germany, Italy, and Sweden. Published labor force shown for France and the Netherlands cannot be derived by adding published employment and published unemployment because labor force is estimated by the OECD using labor force survey sources, whereas unemployment is estimated by national statistical agencies with statistics from a variety of sources, including those of the registered unemployed. For other countries, subtotals may not add to totals because of rounding.

(3) For the United States, Canada, Australia, Japan, Italy, and Sweden, unemployment as recorded by labor force surveys; for France, annual estimates of seasonally adjusted monthly unemployment; for Germany, the registered unemployed; for the Netherlands, a combination of registered unemployed and unemployment as recorded by labor force surveys since 1988; for Netherlands for previous years, the registered unemployed; for the United Kingdom for 1984 forward, unemployment as recorded by labor force surveys; for the United Kingdom for 1971-83, estimated by the Office for National Statistics using time series modeling; and for the United Kingdom for previous years, registered claimants for unemployment benefits.

(4) For the United States, Canada, Australia, and France, unemployment as a percent of the civilian labor force; for Japan, Italy, and Sweden, unemployment as a percent of the civilian labor force plus career military personnel; for Germany, registered unemployed as a percent of the civilian labor force since 1991, for previous years, registered unemployed as a percent of civilian employed wage and salary workers plus the unemployed; for the Netherlands, national estimates of the unemployed as a percent of the total labor force since 1988, for previous years, registered unemployed as a percent of wage and salary workers plus the unemployed; for the United Kingdom, unemployment as a percent of the civilian labor force plus military personnel since 1971 and for previous years, registered claimants for unemployment benefits as a percent of the civilian labor force plus military personnel. Published unemployment rates shown for Germany, the Netherlands, and prior to 1971 for the United Kingdom cannot be derived by dividing published unemployment by published labor force because of these differences in the definition of the national unemployment rate. For France for 1968 onward, published unemployment rates also cannot be derived by dividing published unemployment by published labor force because unemployment and labor force are based on different concepts.

NA = Not available.

* Indicates a break in series. See section on breaks in the Country Notes on pages 4-8 for more information.

(1) Data for 2000 forward for the United States and for 1976 forward for Canada are shown based on the 2002 North American Industry Classification System (NAICS).

(2) Employment totals differ from those in table 2 for Canada, France, the Netherlands, Sweden, and the United Kingdom, because sectoral data for these countries have not been fully adjusted for comparability with U.S. definitions. Sectoral data in table 6 correspond with the published employment series in table 2 for Canada and for the Netherlands for 1987 onward. Prior to 1987, some adjustments were made for Netherlands. For France, employment totals in table 6 differ from those in table 2 because detailed data by sector have not been updated to correspond with employment totals shown in table 2. For Sweden, sectoral data in table 6 include persons aged 16-74 years; data in table 2 are for persons aged 16 and older. For the United Kingdom, the employment totals in table 6 differ from those in table 2 because the data sources differ. Because of rounding, subtotals may not add to totals.

(3) Agriculture, forestry, hunting, and fishing.

(4) Manufacturing, mining, and construction.

(5) Prior to 1993, public utilities are included in industry. In 1993, public utilities accounted for 1.0 percent of total employment.

(6) For 1993 forward, some mining is included in manufacturing.

(7) Transportation, communication, public utilities, trade, finance, public administration, private household services, and miscellaneous services.

NA = Not available.

* Indicates a break in series. See section on breaks in the Country Notes on pages 4-8 for more information.

(1) Data for 2000 forward for the United States and for 1976 forward for Canada are shown based on the 2002 North American Industry Classification System (NAICS).

(2) Because of rounding, subtotals may not add to totals.

(3) Agriculture, forestry, hunting, and fishing.

(4) Manufacturing, mining, and construction.

(5) Prior to 1993, public utilities are included in industry. In 1993, public utilities accounted for 1.0 percent of total employment.

(6) For 1993 forward, some mining is included in manufacturing.

(7) Transportation, communication, public utilities, trade, finance, public administration, private household services, and miscellaneous services.
