STATE JOB OPENINGS AND LABOR TURNOVER – DECEMBER 2021

Job openings rates increased in 7 states, decreased in 4 states, and were little changed in 39 states and the District of Columbia on the last business day of December, the U.S. Bureau of Labor Statistics reported today. Hires rates decreased in 6 states, increased in 1 state, and were little changed in 43 states and the District of Columbia. Total separations rates decreased in 15 states, increased in 2 states, and were little changed in 33 states and the District of Columbia. Nationally, the job openings, hires, and total separations rates were little changed in December. (See tables A-E.)

This release includes estimates of the number and rate of job openings, hires, total separations, quits, and layoffs and discharges for the total nonfarm sector and for all states and the District of Columbia.

Job Openings

In December, **job openings rates** increased in 7 states and decreased in 4 states. The largest increases in job openings rates occurred in Wyoming (+1.8 percentage points), Pennsylvania (+1.1 points), and Minnesota (+0.9 point). The job openings rates decreased in Alabama, Massachusetts, Michigan, and New York (-0.5 point each). The national job openings rate was unchanged. (See table A.)

The **number of job openings** increased in 9 states and decreased in 6 states in December. The largest increases occurred in Pennsylvania (+73,000), New Jersey (+29,000), and Minnesota (+28,000). The largest decreases in the job openings level occurred in New York (-52,000), Michigan (-24,000), and Ohio (-22,000). Nationally, the number of job openings was little changed. (See table A.)

Hires

In December, **hires rates** decreased in 6 states and increased in 1 state. The largest decreases in hires rates occurred in Hawaii (-2.1 percentage points), Florida (-1.3 points), and Idaho (-0.8 point). The increase occurred in Virginia (+0.5 percentage point). The national hires rate was little changed. (See table B.)

The **number of hires** decreased in 7 states in December. The largest decreases occurred in Florida (-116,000), California (-76,000), and Illinois (-27,000). Nationally, the number of hires decreased 333,000. (See table B.)

Total Separations

In December, **total separations rates** decreased in 15 states and increased in 2 states. The largest decreases occurred in New Hampshire (-2.1 percentage points), and Connecticut and Montana (-1.5 points each). The total separations rate increased in Alaska (+2.2 percentage points) and Virginia (+0.8 point). The national total separations rate was little changed over the month. (See table C.)

The **number of total separations** decreased in 15 states in December and increased in 2 states. The largest decreases occurred in Pennsylvania (-55,000), Illinois (-40,000), and Georgia (-39,000). The increases in total separations level occurred in Virginia (+31,000) and Alaska (+7,000). Nationally, the number of total separations decreased 305,000. (See table C.)

Quits

In December, **quits rates** decreased in 13 states and increased in 4 states. The largest decreases in quits rates occurred in New Hampshire (-1.6 percentage points), Montana (-1.0 point), and Kentucky (-0.9 point). The largest increases in the quits rate occurred in Alaska (+1.6 percentage points), Virginia (+0.7 point), and Ohio (+0.5 point). Over the month, the national quits rate was little changed. (See table D.)

The **number of quits** decreased in 12 states and increased in 4 states in December. The largest decreases in the quits level occurred in North Carolina (-34,000), Illinois (-30,000), and Georgia (-24,000). The largest increases in the quits level occurred in Virginia (+28,000), Ohio (+26,000), and Missouri (+10,000). Nationally, the number of quits edged down over the month (-161,000). (See table D.)

Layoffs and Discharges

In December, **layoffs and discharges rates** decreased in 10 states and increased in 1 state. The largest decreases in layoffs and discharges rates occurred in Wyoming (-1.1 percentage points), Connecticut (-0.9 point), and Montana and Pennsylvania (-0.7 point each). The increase occurred in Indiana (+0.3 percentage point). The national layoffs and discharges rate was little changed. (See table E.)

The **number of layoffs and discharges** decreased in 9 states and increased in 1 state in December. The largest decreases in layoffs and discharges were in Pennsylvania (-44,000), Florida (-36,000), and New Jersey (-25,000). The increase occurred in Indiana (+11,000). Nationally, the number of layoffs and discharges was little changed over the month. (See table E.)

For more information, please see the JOLTS interactive charts at www.bls.gov/charts/state-job-openings-and-labor-turnover/state-job-openings-rates.htm#.

The Job Openings and Labor Turnover Survey State estimates for January 2022 are scheduled to be released on Thursday, March 17, 2022 at 10:00 a.m. (ET).

Technical Note

This news release presents statistics from the Job Openings and Labor Turnover Survey (JOLTS). The JOLTS program provides information on labor demand and turnover. Additional information about the JOLTS program can be found at www.bls.gov/jlt/. Estimates are published for job openings, hires, quits, layoffs and discharges, and total separations. The JOLTS program covers all private nonfarm establishments, as well as civilian federal, state, and local government entities in the 50 states and the District of Columbia. Industries are classified in accordance with the North American Industry Classification System.

Definitions and Methodology (National/State)

Shared definitions and procedures for National and State JOLTS Estimates can be found at:

www.bls.gov/news.release/jolts.tn.htm

Data Element Definitions

Employment. Employment includes persons on the payroll who worked or received pay for the pay period that includes the 12th day of the reference month. Full-time, part-time, permanent, short-term, seasonal, salaried, and hourly employees are included, as are employees on paid vacation or other paid leave. Proprietors or partners of unincorporated businesses, unpaid family workers, or employees on strike for the entire pay period, and employees on leave without pay for the entire pay period are not counted as employed. Employees of temporary help agencies, employee leasing companies, outside contractors, and consultants are counted by their employer of record, not by the establishment where they are working. JOLTS does not publish employment estimates but uses the reported employment for validation of the other reported data elements.

Job Openings. Job openings include all positions that are open on the last business day of the reference month. A job is open only if it meets all three of these conditions:

- A specific position exists and there is work available for that position. The position can be full-time or part-time, and it can be permanent, short-term, or seasonal.

- The job could start within 30 days, whether or not the employer can find a suitable candidate during that time.
- The employer is actively recruiting workers from outside the establishment to fill the position. Active recruiting means that the establishment is taking steps to fill a position. It may include advertising in newspapers, on television, or on the radio; posting Internet notices, posting "help wanted" signs, networking or making "word-of-mouth" announcements; accepting applications; interviewing candidates; contacting employment agencies; or soliciting employees at job fairs, state or local employment offices, or similar sources.

Excluded are positions open only to internal transfers, promotions or demotions, or recall from layoffs. Also excluded are openings for positions with start dates more than 30 days in the future, positions for which employees have been hired but the employees have not yet reported for work, and positions to be filled by employees of temporary help agencies, employee leasing companies, outside contractors, or consultants. The job openings rate is computed by dividing the number of job openings by the sum of employment and job openings and multiplying that quotient by 100.

Hires. Hires include all additions to the payroll during the entire reference month, including newly hired and rehired employees; full-time and part-time employees; permanent, short-term, and seasonal employees; employees who were recalled to a job at the location following a layoff (formal suspension from pay status) lasting more than 7 days; on-call or intermittent employees who returned to work after having been formally separated; workers who were hired and separated during the month, and transfers from other locations. Excluded are transfers or promotions within the reporting location, employees returning from strike, employees of temporary help agencies, employee leasing companies, outside contractors, or consultants. The hires rate is computed by dividing the number of hires by employment and multiplying that quotient by 100.

Separations. Total Separations include all separations from the payroll during the entire reference month and is reported by type of separation: quits, layoffs and discharges, and other separations. Quits include employees who left voluntarily with the exception of retirements or

transfers to other locations. Layoffs and discharges includes involuntary separations initiated by the employer including layoffs with no intent to rehire; layoffs (formal suspensions from pay status) lasting or expected to last more than 7 days; discharges resulting from mergers, downsizing, or closings; firings or other discharges for cause; terminations of permanent or short-term employees; and terminations of seasonal employees (whether or not they are expected to return the next season). Other separations include retirements, transfers to other locations, separations due to employee disability; and deaths. Excluded from other separations are transfers within the same location; employees on strike; employees of temporary help agencies, employee leasing companies, outside contractors, or consultants. The other separations component is not published for states due to its comparatively high error, and because it comprises less than 8% of total separations. The separations rate is computed by dividing the number of separations by employment and multiplying that quotient by 100. The quits and layoffs and discharges rates are computed similarly.

State Estimates Methodology

The JOLTS sample of 21,000 establishments does not directly support the production of sample based state estimates. However, state estimates have been produced by combining the available sample with model-based estimates.

These estimates consist of four major estimating models; the **Composite Regional** model, the **Synthetic** model, the **Composite Synthetic** model, and the **Extended Composite Synthetic** model. The Composite Regional model uses JOLTS microdata, JOLTS regional published estimates, and Current Employment Statistics (CES) employment data. The Composite Synthetic model uses JOLTS microdata and Synthetic model estimates derived from monthly employment changes in microdata from the Quarterly Census of Employment and Wages (QCEW), and JOLTS published regional data. The Extended Composite Synthetic extends the Composite Synthetic estimates by ratio-adjusting the Composite Synthetic by the ratio of the current Composite Regional model estimate to the Composite Regional model estimate from one year ago.

The Extended Composite Synthetic model (and its major component—the Composite Regional

model) is used to extend the Composite Synthetic estimates because all of the inputs required by this model are available at the time monthly estimate are produced. In contrast, the Composite Synthetic model (and its major component—the Synthetic model) can only be produced when the latest QCEW data are available. The current model uses the Extended Composite Synthetic model estimates to extend the Composite Synthetic model estimates during the annual JOLTS re-tabulation process. The extension of the Composite Synthetic model using current data-based Composite Regional model estimates will ensure that the Composite Synthetic model estimates reflect current economic trends.

The Composite Regional model calculates state-level JOLTS estimates from JOLTS microdata using sample weights, and the adjustments for non-response (NRAF). The Composite Regional estimate is then benchmarked to CES state-supersector employment to produce state-supersector estimates. The JOLTS sample, by itself, cannot ensure a reasonably sized sample for each state-supersector cell. The small JOLTS sample results in quite a number of state-supersector cells that lack enough data to produce a reasonable estimate. To overcome this issue, the state-level estimates derived directly from the JOLTS sample are augmented using JOLTS regional estimates when the number of respondents is low (that is, less than 30). This approach is known as a composite estimate which leverages the small JOLTS sample to the greatest extent possible and supplements that with a model-based estimate.

In this approach, the JOLTS microdata-based estimate is used, without model augmentation, in all state-supersector cells that have 30 or more respondents. The JOLTS regional estimate will be used, without a sample-based component, in all state-supersector cells that have fewer than five respondents. In all state-supersector cells with 5–30 respondents an estimate is calculated that is a composition of a weighted estimate of the microdata-based estimate and a weighted estimate of the JOLTS regional estimate. The weight assigned to the JOLTS data in those cells is proportional the number of JOLTS respondents in the cell (weight=n/30, where n is the number of respondents).

Benchmarking. The JOLTS State estimates utilize and leverage data from three BLS programs; JOLTS, CES, and QCEW. These state estimates are published as a historical series comprised of an historical annually revised benchmark component for

the Composite Synthetic model and a current component Extended Composite Synthetic model which provides monthly "real-time" estimates between lagged benchmarks.

Seasonal adjustment. BLS uses X-13 ARIMA for seasonal adjustment. A concurrent seasonal adjustment methodology is used in which new seasonal adjustment factors are calculated each month, using all relevant data, up to and including current month data. JOLTS state seasonal adjustment includes both additive and multiplicative models and REGARIMA (regression with auto-correlated errors) modeling to improve the seasonal adjustment factors at the beginning and end of the series and to detect and adjust for outliers in the series. The seasonally adjusted CES over-the-month employment trends are applied to the seasonally adjusted JOLTS state implied employment trends (hires minus separations) forcing them to be approximately the same, while preserving the seasonality of the JOLTS data.

Reliability of the estimates

JOLTS estimates are subject to both sampling and nonsampling error. Sampling error occurs when a sample is surveyed rather than the entire population. There is a chance that the sample estimates may differ from the true population values they represent. The difference, or sampling error, varies depending on the particular sample selected. This variability is measured by the standard error of the estimate. BLS analysis is generally conducted at the 90-percent level of confidence. That means that there is a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the true population value because of sampling error. Sampling error estimates are available on the JOLTS Median Standard Errors page:
http://www.bls.gov/jlt/jolts_median_standard_errors.htm

The JOLTS estimates also are affected by nonsampling error. Nonsampling error can occur for many reasons including: the failure to include a segment of the population; the inability to obtain data from all units in the sample; the inability or unwillingness of respondents to provide data on a timely basis; mistakes made by respondents; errors made in the collection or processing of the data; and errors from the employment benchmark data used in estimation.

The JOLTS State variance estimates account for both sampling error and the error attributable to modeling. A small area domain model uses a Bayesian model to develop estimates of JOLTS State variance. The small area model uses QCEW-based JOLTS synthetic model data to generate a Bayesian prior distribution, then updates the prior distribution using JOLTS microdata and sample-based variance estimates at the State and US Census Regional level to generate a Bayesian posterior distribution. Once the Bayesian posterior distribution has been generated, an estimate of JOLTS State variance estimates is made by drawing 2,500 estimates from the Bayesian posterior distribution. This Bayesian approach thus indirectly accounts for sampling error and directly for model error.
