BUREAU OF LABOR STATISTICS U.S. DEPARTMENT OF LABOR

## Regional and State Unemployment - 2014 Annual Averages

In 2014, annual average unemployment rates declined in all 50 states and the District of Columbia, the U.S. Bureau of Labor Statistics reported today. Employment-population ratios increased in 35 states and the District of Columbia, decreased in 12 states, and were unchanged in 3 states. The U.S. jobless rate decreased by 1.2 percentage points to 6.2 percent in 2014, while the national employment-population ratio increased by 0.4 point to 59.0 percent.

## Regional Unemployment

All four regions had annual average unemployment rate declines from 2013, with the Midwest and Northeast having the largest decreases (-1.4 percentage points each). The Midwest, at 5.8 percent, had the lowest regional unemployment rate in 2014, while the West, at 6.8 percent, had the highest rate. (See table 1.)

Among the nine geographic divisions, the West North Central had the lowest annual average unemployment rate, 4.6 percent in 2014. The Pacific had the highest jobless rate, 7.2 percent. All nine divisions had over-the-year unemployment rate declines, the largest of which occurred in the East North Central (-1.7 percentage points) and Middle Atlantic (-1.5 points).

## Changes to Local Area Unemployment Statistics Data

All subnational estimates presented in this news release, except those for Puerto Rico, were produced using a new generation of time-series models. Information is available in the "Report on Revision to State and Area Time-Series Models" on the BLS website at www.bls.gov/lau/lauschanges2015.htm.

Effective with this news release, data have been re-estimated back to 1976 for regions, divisions, states, and the District of Columbia. The annual average data shown in tables 1 and 2 were affected, as were monthly seasonally adjusted and not seasonally adjusted data.

## State Unemployment

Annual average unemployment rates decreased from 2013 to 2014 in all 50 states and the District of Columbia. This was the first year since 1984 in which all states and the District had over-the-year rate declines. The largest rate decline occurred in Illinois (-2.0 percentage points), followed by Colorado, North Carolina, and Ohio (-1.8 points each). Twenty additional states had over-the-year jobless rate decreases of at least 1.0 percentage point. (See chart 1.)

North Dakota had the lowest annual average unemployment rate (2.8 percent) in 2014. Nebraska (3.3 percent) and South Dakota (3.4 percent) had the next lowest jobless rates. Eleven additional states had annual average unemployment rates under 5.0 percent. Mississippi and Nevada had the highest jobless rates ( 7.8 percent each) among the states, followed by Rhode Island (7.7 percent). The District of Columbia also had a jobless rate of 7.8 percent. (See chart 2 .)

## Regional Employment-Population Ratios

In 2014, all four regions had over-the-year increases in their employment-population ratios-the proportion of the civilian noninstitutional population 16 years of age and older who are employed. The Midwest had the largest increase (+0.8 percentage point). The Midwest also had the highest employment-population ratio, 61.3 percent, while the South had the lowest, 57.9 percent. (See table 2.)

Eight of the 9 geographic divisions had over-the-year increases in their employment-population ratios, with the largest of these occurring in the East North Central ( +1.0 percentage point). The East South Central had the only ratio decline over the year ( -0.9 percentage point). The West North Central had the highest proportion of employed persons, 65.3 percent in 2014, while the East South Central had the lowest proportion, 53.6 percent.

## State Employment-Population Ratios

In 2014, Hawaii and Indiana had the largest over-the-year increases in their employment-population ratios ( +1.4 percentage points each), followed by Louisiana ( +1.2 points) and Connecticut ( +1.1 points). Sixteen additional states had increases of at least 0.5 percentage point. Mississippi and Tennessee had the largest decreases in their employment-population ratios ( -1.2 percentage points each). Four other states had declines of at least 0.5 percentage point.

North Dakota had the highest proportion of employed persons, 70.8 percent in 2014. Four other states in the West North Central division had the next highest ratios: Nebraska, 68.9 percent; Iowa, 67.3 percent; Minnesota, 67.0 percent; and South Dakota, 66.9 percent. West Virginia had the lowest employmentpopulation ratio among the states, 49.7 percent. West Virginia has had the lowest employmentpopulation ratio each year since the series began in 1976. Three states had the lowest employmentpopulation ratios in their series in 2014: Kentucky, 54.8 percent; Mississippi, 50.1 percent; and New Mexico, 53.6 percent. (See chart 3.)

[^0]
## Technical Note

This release presents labor force and unemployment data for census regions and divisions and states from the Local Area Unemployment Statistics (LAUS) program. The LAUS program is a federal-state cooperative endeavor.

## Concepts

Definitions. The labor force and unemployment data are based on the same concepts and definitions as those used for the official national estimates obtained from the Current Population Survey (CPS), a sample survey of households that is conducted for the Bureau of Labor Statistics (BLS) by the U.S. Census Bureau. The LAUS program measures employment and unemployment on a place-of-residence basis. The universe for each is the civilian noninstitutional population 16 years of age and older. Employed persons are those who did any work at all for pay or profit in the reference week (the week including the 12th of the month) or worked 15 hours or more without pay in a family business or farm, plus those not working who had a job from which they were temporarily absent, whether or not paid, for such reasons as labor management dispute, illness, or vacation. Unemployed persons are those who were not employed during the reference week (based on the definition above), had actively looked for a job sometime in the 4 -week period ending with the reference week, and were currently available for work; persons on layoff expecting recall need not be looking for work to be counted as unemployed. The labor force is the sum of employed and unemployed persons. The unemployment rate is the number of unemployed expressed as a percent of the labor force. The employment-population ratio is the proportion of the civilian noninstitutional population 16 years of age and older that is employed.

Method of estimation. Estimates for 48 of the 50 states, the District of Columbia, the Los Angeles-Long BeachGlendale metropolitan division, New York City, and the balances of California and New York State are produced using estimating equations based on regression techniques. This method utilizes data from several sources, including the CPS, the Current Employment Statistics (CES) survey of nonfarm payroll employment, and state unemployment insurance (UI) programs. Estimates for the State of California are derived by summing the estimates for the Los Angeles-Long Beach-Glendale metropolitan division and the balance of California. Similarly, estimates for New York State are derived by summing the estimates for New York City and the balance of New York State. Estimates for all nine census divisions are based on a similar regression approach that does not incorporate CES or UI data. Estimates for census regions are obtained by summing the model-based estimates for the component
divisions and then calculating the unemployment rate. Each month, census division estimates are controlled to national totals; state estimates are then controlled to their respective division totals. Estimates for Puerto Rico are derived from a monthly household survey similar to the CPS. A detailed description of the estimation procedures is available from BLS upon request.

Annual revisions. Labor force and unemployment data for prior years reflect adjustments made at the end of each year. The adjusted estimates incorporate updated population controls from the U.S. Census Bureau, any revisions in the other data sources, and model reestimation. The population controls (except for Puerto Rico) reflect extrapolation from the 2010 Census. In most years, historical data for the most recent 5 years (both seasonally adjusted and not seasonally adjusted) are revised near the beginning of each calendar year, prior to the release of January estimates. Though the labor force estimates typically are updated for 5 years, the population estimates are adjusted back to the decennial estimates base (April 2010). With the introduction of a new generation of times-series models in 2015, historical data were reestimated back to January 1976 for regions, divisions, states, the District of Columbia, the Los Angeles-Long Beach-Glendale metropolitan division, New York City, and the balances of California and New York states.

## Reliability of the estimates

The estimates presented in this release are based on sample surveys, administrative data, and modeling and, thus, are subject to sampling and other types of errors. Sampling error is a measure of sampling variability-that is, variation that occurs by chance because a sample rather than the entire population is surveyed. Survey data also are subject to nonsampling errors, such as those which can be introduced into the data collection and processing operations. Estimates not directly derived from sample surveys are subject to additional errors resulting from the specific estimation processes used. In table 1, level estimates for states may not sum to level estimates for regions and divisions because of rounding. Unemployment rates and employment-population ratios are computed from unrounded levels and, thus, may differ slightly from rates and ratios computed using the rounded level estimates displayed in table 1.

## Additional information

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: (202) 691-5200; Federal Relay Service: (800) 877-8339.
