

## Occupational salary levels for white-collar workers, 1985

Carl Prieser

White-collar salaries increased moderately between March 1984 and March 1985, according to the Bureau of Labor Statistics' survey of pay for professional, administrative, technical, and clerical occupations in medium and large firms. Salary levels rose between 3 and 6 percent for most of the 25 occupations, compared with those in the March 1984 survey. In contrast, occupational salary increases averaged about 7 percent yearly during the 1970's and rose to more than 9 percent in 1981 and 1982 before starting to drop back in 1983. (See table 1.) The annual survey is used in the pay comparability process for Federal white-collar employees. ${ }^{1}$
Although the survey focuses on individual occupations and work levels, it also permits a look at salary trends by skill level. In this connection, occupational work levels were grouped into three broad categories of skill levels comparable to grades 1 to 4,5 to 9 , and 11 to 15 , respectively, of the Federal Government's General Schedule (cs). (See table 2 for identification of the survey job classifications by GS grade.) Cumulative percentage increases over the past 5 years have been largest for the higher levels ( 45.4 percent) 5 to 6 percentage points more than for middle (40.8) and lower (39.4) groups. In 1984-85, pay increases for the highest skill group again set the pace, averaging 5.9 percent, compared with 4.2 percent for each of the other two groups.

A closer look at some individual job classifications reveals that the pay differential between entry-level professionals and their experienced coworkers widened during the first half of the 1980 's, as the latter generally recorded substantially larger salary increases. The following tabulation illustrates this point for four professional occupations. It shows average salaries for journeyman classifications (GS-11 equivalents) as a percent of the average paid to their corresponding entry-levels (GS-5). ${ }^{2}$

[^0]|  | 1980 | 1985 |
| :---: | :---: | :---: |
| Accountant | 173 | 183 |
| Auditor. | 180 | 186 |
| Chemist | 171 | 174 |
| Engineer | 147 | 150 |

It is noteworthy that the journeyman to entry-level differential for engineers continues to be much smaller than for the other professions studied. To a great extent, this reflects the strong demand for engineers that has bolstered their starting salaries. For example, in 1985, the average salary for entry-level engineers was 21 percent higher than that for starting chemists, while at the journeyman level the difference was 4 percent (table 2).
In 1985, the survey's highest salary average was for toplevel (vi) corporate attorneys at $\$ 91,690$ a year; this was more than four times the average for most entry-level professional classifications studied. These extremes reflect the wide

${ }^{1}$ Occupational employment estimates relate to the total in all establishments within scope of the survey and not to the number actually surveyed.
${ }^{2}$ Salaries reported relate to the salaries that were paid for standard work schedules; that is, the straight-time salary corresponding to employee's normal work schedule excluding overtime hours. Nonproduction bonuses are excluded, but cost-of-living adjustments and incentive earnings are included.

Note: The following occupational levels were surveyed but insufficient data were obtained to warrant publication: Chief accountant v : director of personnel v ; chemist vill: computer operator vi; personnel clerk/assistant v: and photographer v. The programmer/ programmer analyst title has been shortened to "computer programmer" in 1985; the definition, however, is unchanged from 1984
range of duties and responsibilities represented by all professional categories covered by the survey.
In the clerical area, differing functions and skill levels also produce wide variations, although not as wide as for professionals. For example, annual pay averages for toplevel secretaries ( v ) $(\$ 26,210)$ and purchasing assistants (iII) $(\$ 28,150)$ were 2.5 times the average of clerks $(\$ 10,101)$ doing routine filing.
In contrast to these types of comparisons, the typical spread among job categories with equivalent levels of work, was relatively narrow. See, for example, accountants I and accounting clerks IV in table 2.
The Bureau's most recent additions to the survey were two computer science occupations-programmers in 1982 and systems analysts in 1984. Programmer trainees (level 1) averaged $\$ 20,318$ a year; this was approximately half the average of level v workers who plan and direct large com-
puter programming projects or solve unusually complex programming problems. Computer systems analysts i averaged $\$ 28,197$ a year. This level includes workers who are familiar with systems analysis procedures and are working independently on routine problems. Systems analysts VI averaged $\$ 68,809$ a year. At this level, analysts are senior managers responsible for the development and maintenance of very large and complex systems.

A detailed analysis of white-collar salaries and complete results of this year's survey are contained in the National Survey of Professional, Administrative, Technical, and Clerical Pay, March 1985, BLS Bulletin 2243, August 1985. It includes salary distributions by occupational work level, and relative employment and salary levels by industry division for the 25 occupations studied.
$\qquad$
${ }^{1}$ The National Survey of Professional, Administrative, Technical, and Clerical Pay (PATC) is conducted by the Bureau of Labor Statistics, but survey occupations and coverage such as establishment size and the private industries to be included are determined by the President's Pay Agentthe Secretary of Labor and the Directors of the Office of Management and Budget and the Office of Personnel Management. The Agent has designated the industrial coverage and minimum size establishment as follows: manufacturing, transportation, communications, and public utilities, 100 or 250 employees; mining and construction, 250 employees; wholesale trade, 100 employees; retail trade, 250 employees; finance, insurance, and real estate, 100 employees; and selected services, 50 or 100 employees. The pay-setting role of the PATC survey is described in George L. Stelluto's "Federal pay comparability: facts to temper the debate," Monthly Labor Review, June 1979, pp. 18-28.
${ }^{2}$ Except for engineers, this widening of differentials continues an earlier
trend. For example, the journeyman to entry-level ratio in 1975 was 162 for accountants, 166 for auditors, and 163 for chemists. The engineer ratio was 151 in 1975.

A similar pattern was found for the 1980-85 period in the salary relationship of recent law school graduates with bar membership (attomeys 1 , GS-9 equivalents) and attorneys with experience handling legal work with few precedents (attorneys in1, GS-12 equivalents). The salary relatives were 158 in 1980 and 160 in 1985. (In 1975, the corresponding relative was 148.)

In the survey coding scheme, the level designations among various occupations are not synonymous: For example, the first level of attorneys equates to the third levels of accountants, chemists, and most other professional and administrative occupations. Classification of employees in the occupations and work levels surveyed is based on factors detailed in definitions which are available upon request.
