### The October Review

Fasten your seatbelts as you peruse our lead article this month on the turbulence that has afflicted the airline transportation industry in recent years.

As the author Christopher J. Goodman notes, the industry has been buffeted with the recession of 2001 and that year's September 11th terrorist attacks, with financial difficulties, waves of restructuring, changes in passenger volume and, most recently, soaring fuel prices. He documents the expansion of business activity in the industry in the latter half of the 1990s, when passenger volume was increasingly steadily, profits were generally sound, and employment was growing. The recession of 2001 sharply affected demand for air travel, especially among business travelers, and the September 11th attacks exacerbated an already difficult situation. Although air travel eventually began to grow again, it did not translate into renewed growth in airline employment; in fact, the number of jobs in the industry has not returned to pre-recession levels.

Over the years, the *Monthly Labor Review* from time to time has published articles taking a historical look at changes in labor-related programs, laws, or regulations. Stephen A. Wandner this month provides a history of three employment services programs related to the unemployment insurance system: Worker Profiling and Reemployment Services; Short-Time Compensation; and Self-Employment Assistance.

James A. Walker provides a look at

union membership in 2007 in a visual essay. Using annual average figures from the Current Population Survey, he examines the current composition of union membership by industry, occupation, age and other variables. He also provides some historical perspective by showing long-term trends in union membership rates overall, as well as those for men and women and major race/ethnic groups.

### Women's earnings

The ratio of women's to men's earnings has been a statistic widely examined for a long time. The latest annual average data—for 2007—indicate that women who were full-time wage and salary workers had median weekly earnings of \$614, or about 80 percent of the \$766 median for their male counterparts. This ratio has grown since 1979 (the first year for which earnings data from the Current Population Survey are comparable to current figures), when women earned about 62 percent as much as men.

The occupational distribution of female and male full-time workers differs significantly. Relatively few women work in construction, production, or transportation occupations, for instance, whereas the concentration of men in administrative support jobs is small. The types of jobs women and men hold, as well as other variables such as educational attainment and work experience, can contribute to overall wage differences between the sexes.

A full range of comparative information on women's and men's earnings is found in an annual publication

produced by the Bureau of Labor Statistics called *Highlights of Women's Earnings*. The edition with data for 2007 can be found online at <http://www.bls.gov/cps/cpswom2007.pdf>

### The nonprofit sector

Nonprofit organizations are a growing presence in the U.S. economy. In 1994, according to the IRS, there were slightly more than 1.1 million nonprofit organizations in the country, and that figure had risen to more than 1.6 million in 2007. According to BLS data, nonprofits in 1994 employed about 5.4 million people, or 4.4 percent of all workers; by 2007, they employed 8.7 million workers, or nearly 6 percent of all workers.

Examples of nonprofits include hospitals, churches, educational institutions, and charities. In the first of a series of articles to be published in *Compensation and Working Conditions Online*, Amy Butler uses data from the BLS National Compensation Survey to examine the wage rates of managers and selected professional and administrative support workers in nonprofit organizations. She compares the rates for those workers with their counterparts in private industry and State and local government. Among her conclusions, she finds that full-time workers in these kinds of jobs had higher hourly wages in nonprofits than in private industry, but lower hourly wages than in State and local government.

The article can be found online at <http://www.bls.gov/opub/cwc/cm20081022ar01p1.htm> □

## Takeoff and descent of airline employment

*After several years of growth, airline employment declined with the recession of 2001 and the attacks of September 11th; subsequently, although air travel began to rebound, the number of jobs has not recovered fully; in 2008, the industry has faced, soaring fuel prices and a weakening economy*

Christopher J. Goodman

The airline industry in the United States has gone through major changes in recent years. After growing sharply throughout the late 1990s, the industry began to falter around the turn of the century.<sup>1</sup> An economic downturn compounded by the catastrophic events of September 11, 2001, induced the largest decline in air travel in modern aviation. By 2003, air travel was once again growing<sup>2</sup>; however, the industry's fiscal position continued to deteriorate. In the face of mounting financial losses, the airlines aimed to reduce their expenditures on labor, leading to massive job losses in the industry. Airlines were hampered in their restructuring efforts by historically high fuel prices, which added further pressure to reduce employment. During the period from 2003 to 2006, the historical relationship between passenger volume and employment in the industry broke down. From its peak in March 2001, employment in the industry declined for 5 straight years.<sup>3</sup> The industry did not begin to show signs of a recovery until 2007.

### Structure of the airline industry

The passenger airline industry can be divided roughly into three categories: network, or "legacy," carriers; discount, or low-cost,

carriers; and regional carriers. Legacy carriers constitute the industry's largest airlines. Responsible for the majority of passenger transportation, they are longstanding airlines that began operations prior to deregulation in 1978. Noted for their large domestic networks, they have traditionally offered many services not found on lower cost carriers, such as first class seating and membership clubs. As a result, network carriers have continued to remain popular with business travelers. They are also the primary conduit for international travel and are noted for their extensive hub-and-spoke networks. Each of these networks generally routes passengers to one of the airline's major hubs, where the passengers then fly on to their ultimate destination. Since 2000, these airlines have suffered financially as they have gradually lost market share to discount and regional carriers.

Discount carriers, the second major group, have arisen largely since the Airline Deregulation Act of 1978. Discount carriers are noted for offering low fares and basic, or "no frills," services. Eschewing the hub-and-spoke model of larger airlines, discounters concentrate on point-to-point service. Focusing on the domestic passenger market, these carriers typically fly to fewer cities than the major airlines and do not of-

for international flights. Discount carriers have proven to be popular with those traveling for leisure.

The third group responsible for passenger services is the regional carriers. As their name implies, regional carriers generally lack a national presence and instead focus on serving particular geographic regions. Flying smaller airplanes, these carriers service many smaller markets not served by other carriers. Larger carriers often contract with regional carriers to provide service on less popular routes, where demand is not sufficient to fill larger planes. Regional airlines have experienced the most rapid passenger growth in recent years. The Federal Aviation Administration projects that the market share of regional carriers will expand from 11.9 percent of passengers in 2020 to 19.9 percent in 2015, making these carriers an increasingly important component of air travel.<sup>4</sup>

### Expansion in the late 1990s

Air transportation experienced a steady increase in passenger volume throughout the latter half of the 1990s, because a growing national population and a robust economy led more people to travel for business and pleasure.<sup>5</sup> Demand for air travel continued to grow as personal income in America rose and airline travel became relatively more affordable. The airline industry was by and large profitable, and it experienced healthy employment growth. From January 1995 until January 2000, employment in air transportation expanded by nearly one-fifth, or 97,000 positions.

By the late 1990s, the effects of Internet commerce were starting to be felt across the industry. Travel Web sites allowed consumers to more easily compare air fares,

limiting the pricing power of airlines.<sup>6</sup> The Internet provided airlines with a low cost channel for selling tickets and allowed airlines to increase the total number of tickets sold. Given the low marginal cost of each additional passenger, airlines were able to profit even when selling surplus tickets at greatly reduced rates. (See table 1.)<sup>7</sup>

Throughout the 1990s, the airline industry was able to prosper thanks to historically low fuel prices and increases in passenger volumes. Both of these factors contributed to low per-passenger operating costs, which enabled airlines to reduce fares in an attempt to lure still more passengers.<sup>8</sup> From 1995 to 2000, revenue passenger miles, the most common measure of demand for air travel, rose 28.1 percent. Revenue passenger miles are roughly equal to the number of tickets sold times the average mile per ticket sold.<sup>9</sup> The industry thrived financially during this time period, recording a profit every year from 1995 to 2000. Cumulatively, the airlines recorded profits of more than \$20 billion in the second half of the 1990s and together experienced a 37.6-percent increase in revenue from 1995 to 2000.<sup>10</sup>

### Rapid growth in discount carriers

Although all categories of air carriers expanded in response to growing demand for air travel, discount carriers, in particular, experienced robust growth. During the 1990s, discount airlines grew both in size and in number as they successfully attempted to win market share from the larger companies. Responding to the competitive pressures posed by their upstart rivals, traditional airlines took steps to mimic discount carriers, including decreasing fares to remain competitive. Several sought to head off competition from low-cost carriers by introducing their own discount airlines.

Two factors enabled the discount carriers to grow during this period. Nearly a generation earlier, deregulation had made entrance into the industry easier, giving airlines more latitude in setting prices and lessening the previously onerous process of acquiring regulatory approval to operate new airlines. Additionally, the growth of U.S. capital markets in the 1990s allowed upstart airlines to obtain the vast sums of financial capital necessary to enter the marketplace. Investors eagerly funded new airlines on the premise that upstart airlines, flying direct flights with new fleets and low unit labor costs, would easily unseat older airlines.<sup>11</sup>

Also during the 1990s, many observers of the airline industry believed that the “legacy” carriers were inefficient and would be unable to compete with the newer, leaner

airlines in a price war. According to critics, traditional airlines were burdened with aging fleets and inefficient hub-and-spoke networks. A study by the consulting firm Booz Allen Hamilton found that the discount carriers spent on average only 7 cents to 8 cents per seat-mile to complete a 500- to 600-mile flight, whereas the established carriers spent approximately 15 cents. The analysis also concluded that up to 65 percent of the difference in cost could be attributed to the operational complexity associated with managing a hub-and-spoke model.<sup>12</sup> High labor costs were also seen as a competitive disadvantage for the legacy carriers. It was widely believed that the heavily unionized industry was paying its employees above market wages, a vestige of the prerederegulation era.<sup>13</sup>

The effect of discount carriers on the overall market for air travel was large, and it has generally been considered to have been financially beneficial for consumers. After rising moderately during the early 1990s, airfares remained relatively flat over the course of the late 1990s as low-cost carriers introduced lower fares and legacy carriers responded in kind. Only by 1999, after several years of growth in air travel, did real airfares begin to rise again. (See chart 1.)<sup>14</sup> One study that examined the competitive effect of Southwest Airlines, a large discount carrier, estimated that in 1998 the increased price competition induced by the airline's low-cost model had saved consumers more than \$12.9 billion in airfares across all carriers. Total consumer savings in 1998 were estimated to have been equal to 20 percent of the industry's domestic scheduled passenger revenue and more than half as large as the savings associated with deregulation.<sup>15</sup>

The addition of extra capacity by both large and small carriers caused employment to rise across the airline industry. By March 2001, employment in all of air transportation reached its peak, at 634,000 positions.<sup>16</sup> In the previous 5 years, air transportation had added 110,000 jobs. While they were under pressure from the smaller airlines, the legacy carriers still continued to report healthy financial results and continued plans for further expansion. Available seat-miles, the most widely accepted measure of supply in the airline industry, expanded by nearly one-fifth (18.6 percent) between 1995 and 2000.<sup>17</sup> Record levels of demand for air travel caused the additional capacity to be utilized quickly. Industry load factors, a measure of capacity utilization, continued to rise as passenger growth exceeded the industry's expansion in carrying capacity.<sup>18</sup>

## The recession of 2001

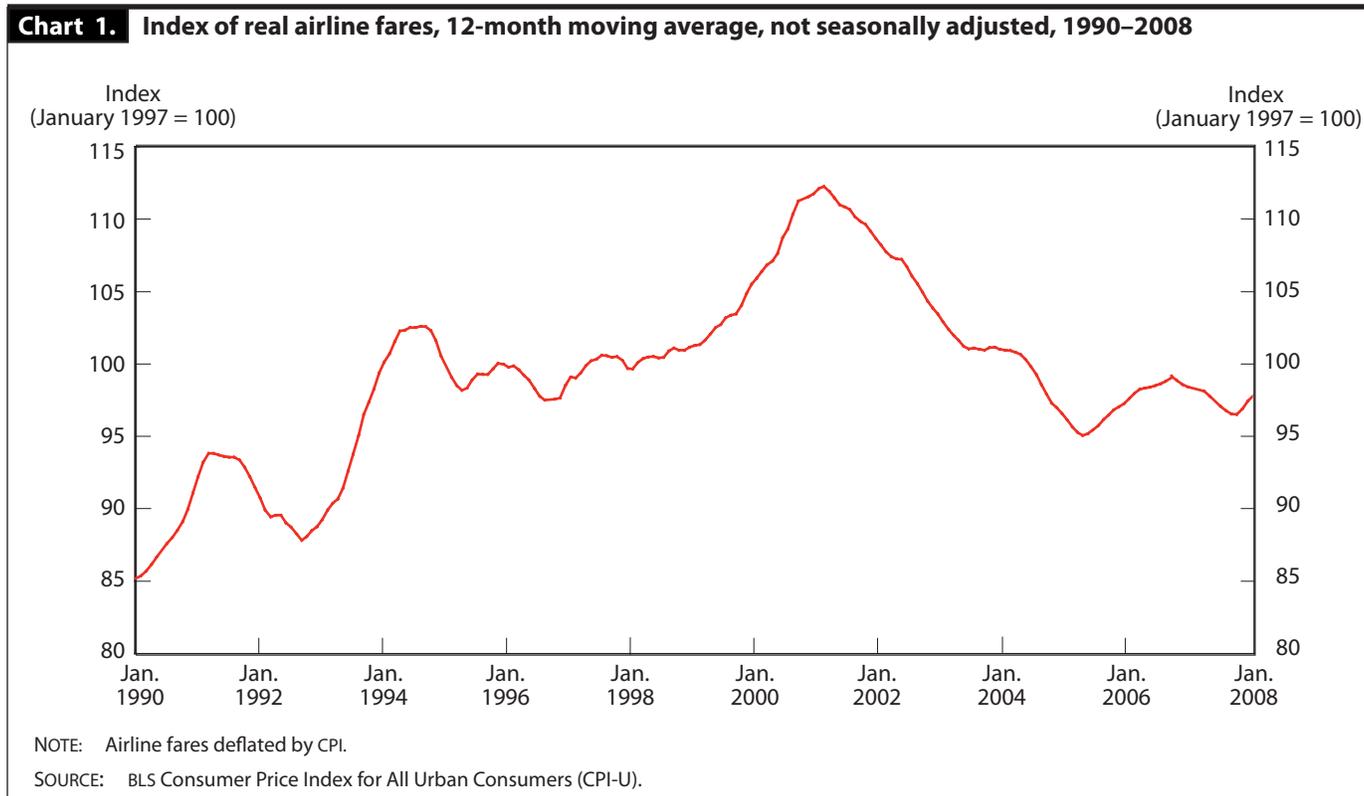

By the second half of 2000, the U.S. economy began to

show signs of slowing. In the third quarter of 2000, gross domestic product (GDP) contracted for the first time in nearly a decade.<sup>19</sup> As the economy weakened, businesses began to reduce staffing levels. The downturn in the broader economy was a major factor in the decline in the demand for air travel, especially the decline among business travelers. Employment in air travel, which had been steadily increasing over the previous 5 years, peaked in March 2001. Over the course of the next 5 months, employment in air transportation edged down as airlines attempted to adjust to the changing market conditions.

The ongoing weakness in the airline industry was compounded by the terrorist attacks of September 11, 2001. Following the attacks, airline travel across the Nation was halted for nearly a week as a precautionary measure. When air travel did resume, airlines experienced a dramatic reduction in passenger traffic; passenger volume on domestic flights declined by 5.9 percent during 2001.<sup>20</sup>

The events of September 11th dramatically changed the public's view of flying. Widespread concerns over the safety of airline travel led Congress to enact new security measures meant to restore the public's confidence. While doing much to assuage lingering fears of flying, the new security procedures dramatically increased the time and effort associated with flying. Passengers were required to arrive earlier and go through enhanced security procedures. The increased security procedures appeared to have effectively calmed the fears that the public had been having about flying. A Gallup survey conducted shortly after the attacks found that more than 80 percent of Americans felt that air travel had become safer since September 11th.<sup>21</sup> However, the increased security appears to have come at a cost to overall customer satisfaction. The University of Michigan's American Customer Satisfaction Index for Airlines, which had been falling in the years prior to the attack, reached its nadir in 2001.<sup>22</sup> The increased time and effort associated with flying not only inconvenienced travelers but also weakened the competitive position of flying relative to other modes of transportation, such as driving or taking a train. Avoiding travel altogether also became more appealing as communication technology, such as teleconferencing, advanced and became more widely available.

Airlines sought to minimize their losses in the face of declining passenger volumes and higher costs. Not only increased security but also higher fuel prices caused this decrease in clientele and increase in costs. Within weeks of the attacks, virtually every major airline had announced drastic layoffs. The BLS Mass Layoff Statistics program reported 75 major layoff events in the 2 months follow-

ing the attacks.<sup>23</sup> From September 11th until the end of 2001, overall employment in air transportation declined by an additional 59,000 positions as carriers adjusted to the decline in air travel. (See chart 2.)

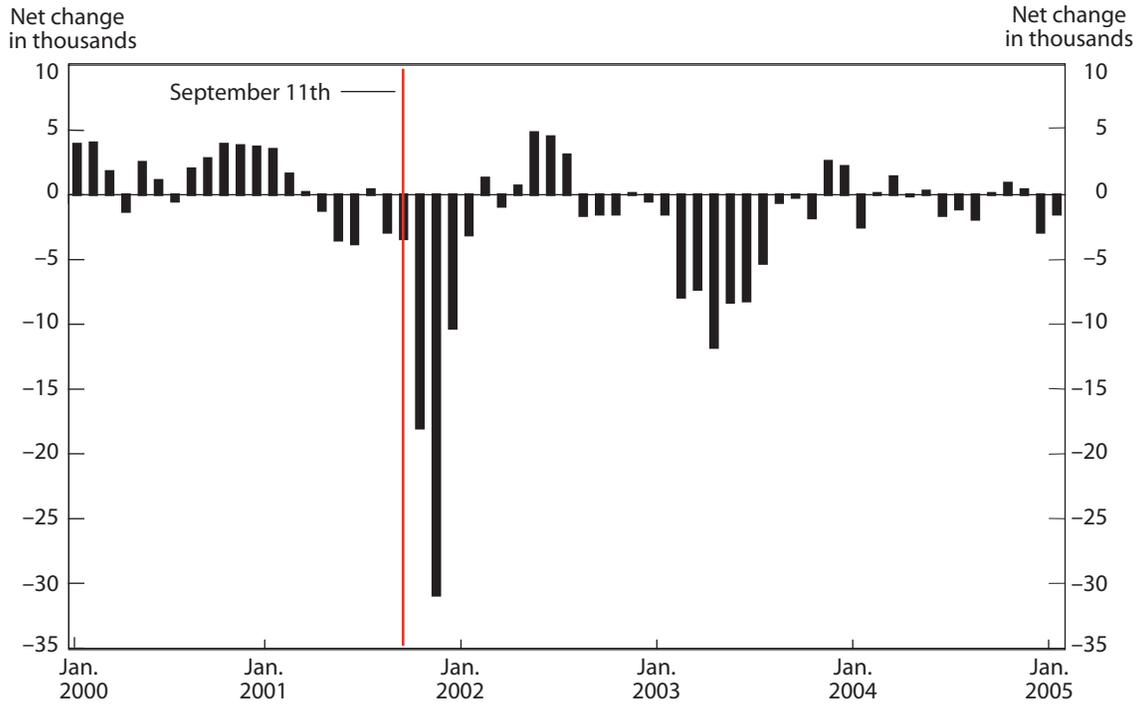

The industry, which had been losing money prior to September 11th, suffered huge financial losses in the wake of the attacks. In 2001, total losses among commercial airlines amounted to \$8.3 billion.<sup>24</sup> According to the industry, the financial damage from the attacks was not confined merely to the losses associated with reduced air travel. Rather, it was argued that the attacks had the potential to threaten, at least in the short term, the financial viability of the entire industry. Two large uncertainties hung over the industry: would the airlines be held legally liable for the attacks? and would insurers be willing to underwrite future policies for the airlines? Air carriers argued that they were near insolvency and would be forced to cease operations if they did not receive outside financial assistance. Sensitive to those concerns, Congress enacted the Air Transportation Safety and System Stabilization Act of 2001. The legislation, which sought to ensure the financial health of the domestic airline industry, provided direct government-backed loans to the airlines. Under the legislation, Congress granted the industry \$5 billion in direct assistance and established a \$10 billion loan fund

for distressed airlines. The act also contained provisions designed to limit the airlines' legal liability for the September 11th attacks.<sup>25</sup>

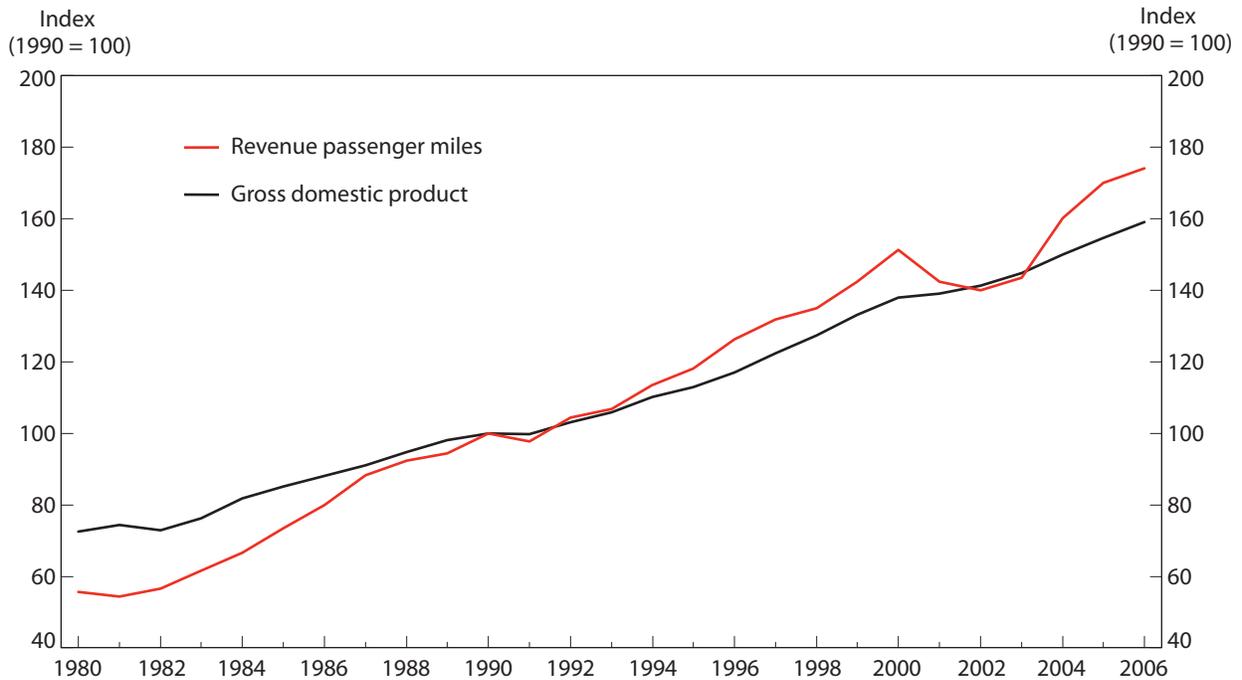

The weak American economy caused air travel to continue its decline through 2002. In the deregulation era, demand for air transportation has generally risen and fallen in line with the broader economy. (See chart 3.) However, the decline in air travel from 2001 to 2002 was especially sharp when compared with previous downturns. Over the course of those 2 years, air traffic, as measured by revenue passenger miles, suffered its worst decline in history, falling by 7.3 percent. This marked only the second time since 1928 that air traffic had declined for 2 consecutive years.<sup>26</sup>

Decreasing numbers of customers caused some airlines to attempt to raise revenue through fare increases, but these increases in price were stiffly resisted by consumers. Unable to raise prices, the airline industry was forced to reduce expenses both through cutting its costs per passenger and by reducing overall capacity. The major expenses that the airline industry regularly faces are labor, fuel, and planes and equipment. In the short term, airlines are constrained in what they can do to limit fuel and equipment costs. With limited room to reduce expenses, airlines attempted to control labor costs. Throughout 2001 and

**Chart 2. Air transportation employment, 1-month net change, seasonally adjusted, 2000–05**

SOURCES: Air Transport Association and Bureau of Economic Analysis.

2002, employment tracked closely with passenger volume, falling 10.0 percent. However, the employment declines were concentrated in 2001, with employment ticking back up in 2002. (See chart 4.) Overall, the general relationship between employment and revenue passenger miles in 2001 and 2002 appears relatively normal when compared with the historical relationship between the two; as usual, the two series were moving roughly in line with each other during that period. (See chart 5.)

### Air travel recovers, job losses continue

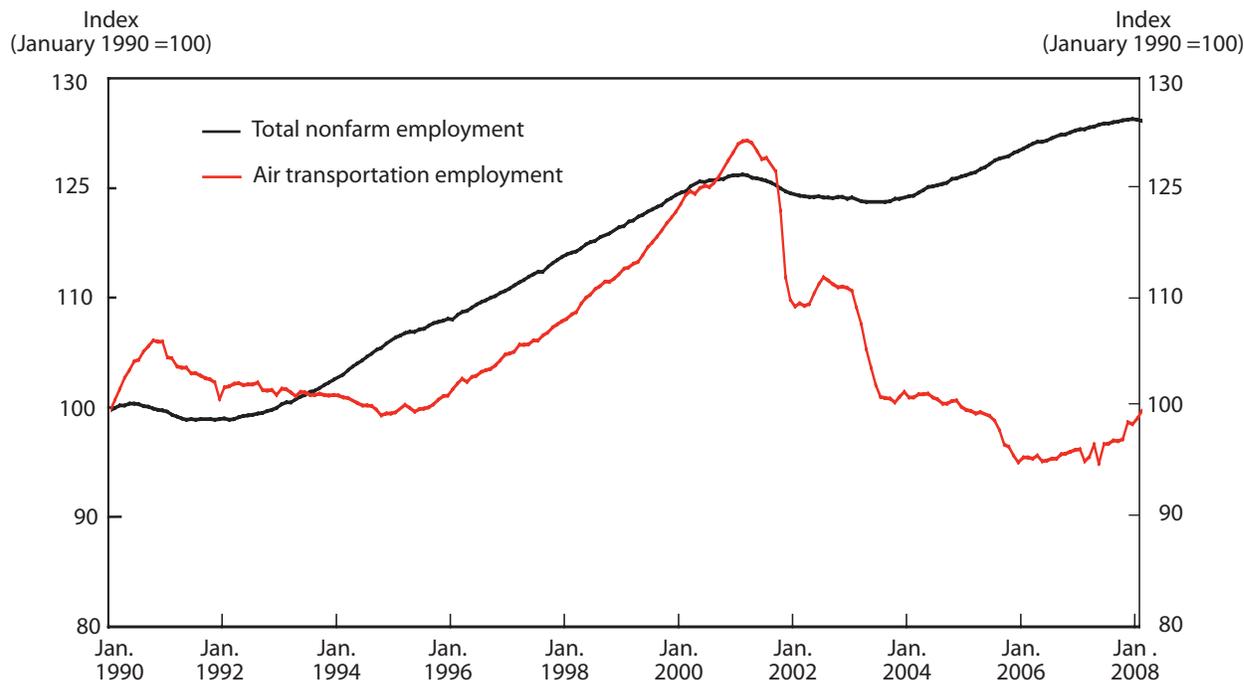

By the end of 2002, passenger volume began growing once again, helping the airlines to recover to some extent. However, in contrast to the late 1990s, growth in air travel did not translate into growth in airline employment. (See chart 5.) Despite a 24-percent rise in passenger volume from 2002 to 2005, employment in air transportation continued to fall, declining by 80,000;<sup>27</sup> the relationship between employment and passenger volume had apparently frayed. Had the relationship between volume and employment witnessed in the late 1990s continued, by 2006 employment in the industry would have been 47

percent higher than it actually was. (See chart 6.)<sup>28</sup>

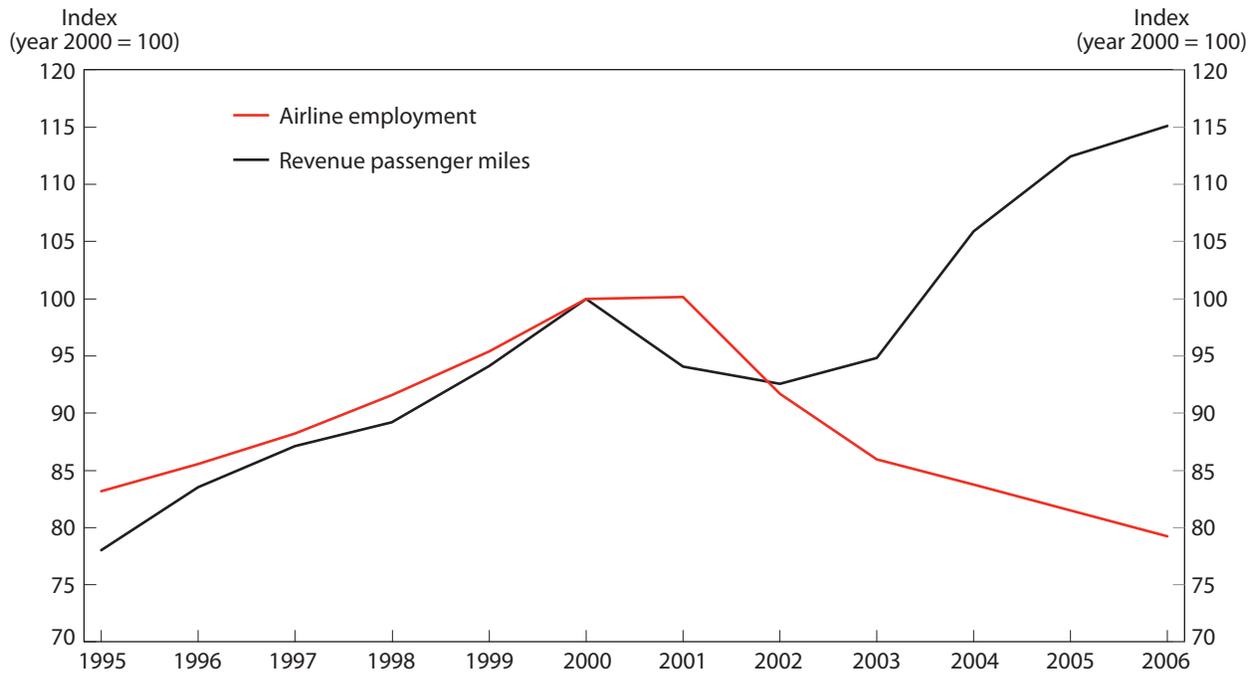

The disconnect between employment and volume was a product of the large financial losses the industry endured from 2002 until 2005. (See chart 7.) Unlike what happened in the late 1990s, increased passenger volume did not translate into an increase in profits during the 2002–05 period. The continued financial losses, despite rising volume, resulted from two main factors: a decline in airline ticket prices—resulting in less revenue per passenger—and rapidly rising fuel prices. The two forces converged to produce the largest financial losses in the history of the industry. From 2001 to 2005, the airline industry lost more than \$35 billion.<sup>29</sup> According to a Brookings Institution study, this translated into a loss of roughly \$13 per passenger.<sup>30</sup> The magnitude of the losses was so large that it exceeded all of the industry’s accumulated profits since 1947. By 2005, the airline industry’s cumulative losses since 1947 stood at \$17.2 billion. Virtually every major airline suffered financially during this period, and the industry experienced 22 bankruptcies from 2000 to 2004.<sup>31</sup>

Despite the recovery in passenger volume, airlines were again largely unsuccessful in their attempts to increase

fares. Their failure has been attributed to the existence of overcapacity in the industry. An industry is generally believed to suffer from overcapacity when there is “an excess of capability to produce goods or provide a service over the level of demand.”<sup>32</sup> Much like the boom and subsequent busts seen in the telecommunications and information technology industries, airlines overestimated their ability to align capacity with future demand.<sup>33</sup> In 2001, total real fixed investment in air transportation was over 300 percent higher than in 1991, despite the industry’s gross output only growing by 41.9 percent.<sup>34</sup> The rapid expansion during the late 1990s left the industry with an abundance of air carriers. The high level of competition allowed consumers to shop around, thereby limiting the pricing power of airlines.

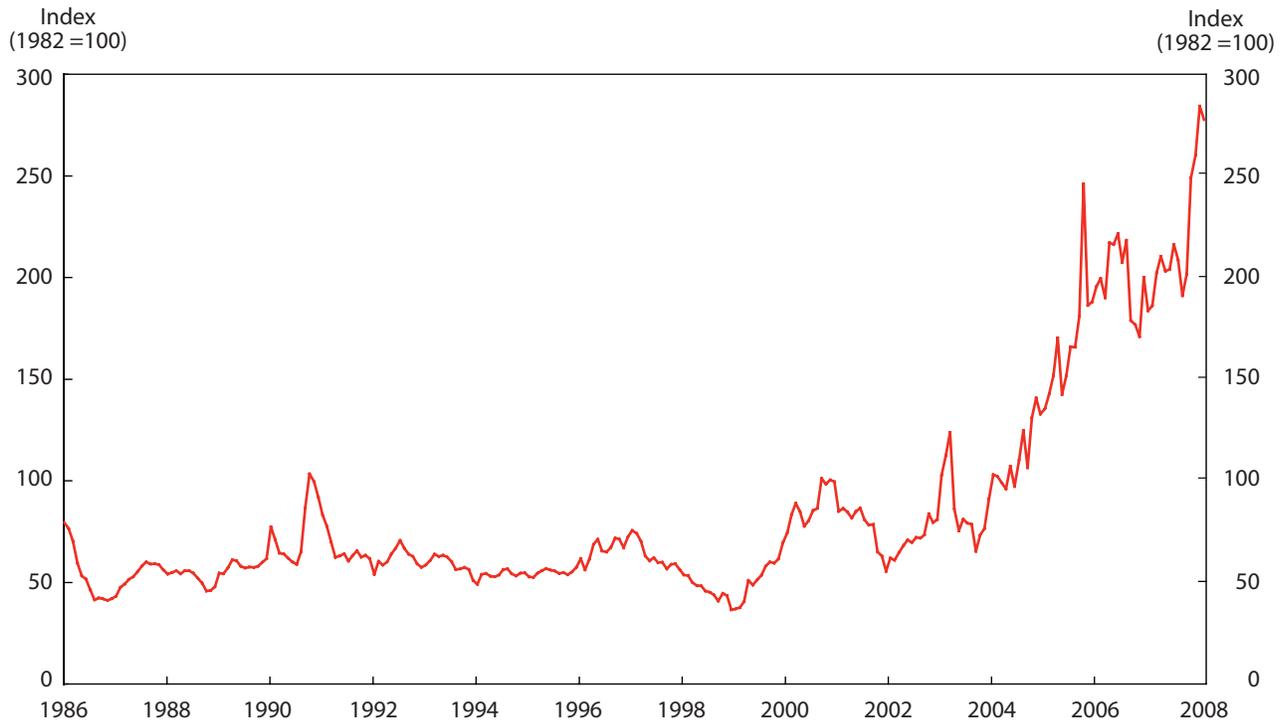

### The effect of high fuel prices

Rising fuel prices have compounded the airline industry’s troubles. Still struggling to recover from the downturn in air travel, airlines have found themselves facing not only tight competition, which limits their ability to raise revenues, but also surging fuel prices. From the relatively low price levels of the late 1990s, airline fuel, a major expense for airlines, has risen dramatically in price. By the middle

of 2006, the price of jet fuel had nearly tripled from its 2001 level. (See chart 8.)<sup>35</sup> As airlines were reducing labor costs, high fuel prices were forcing airlines to dramatically increase their fuel expenditures. By 2006, the cost of fuel had overtaken labor as the industry’s largest single expense, reversing the historical pattern.<sup>36</sup>

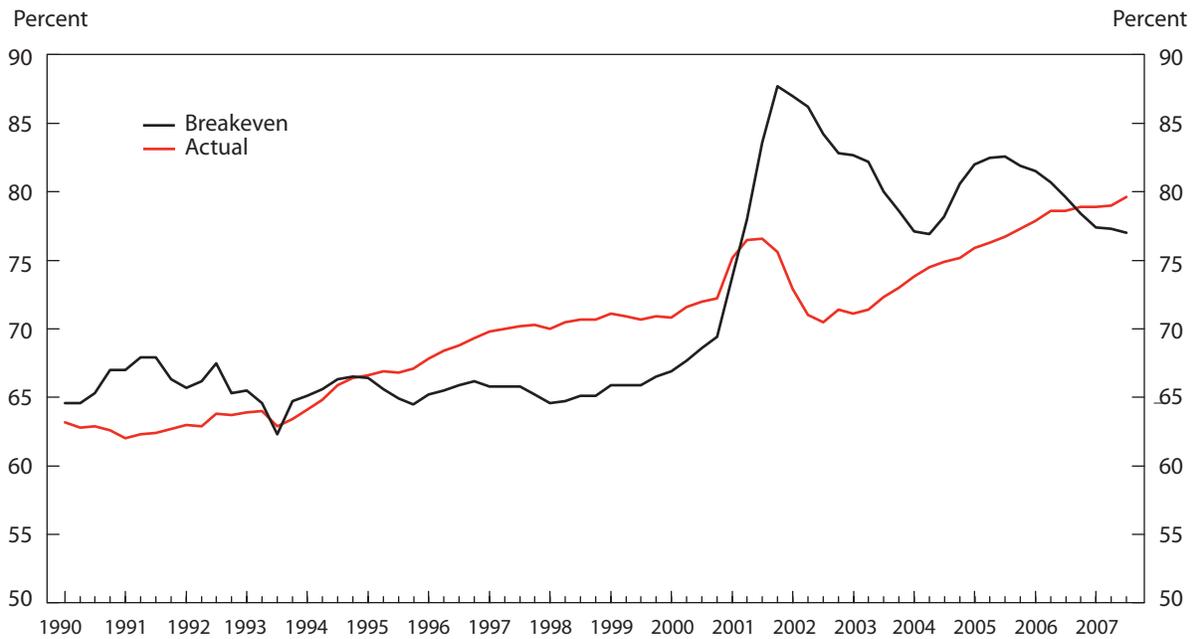

The rapid rise in the price of fuel radically altered the economics of air travel. Because of the rise in the cost of each flight and the stagnation in ticket prices, airlines had to increase the percent of seats they sold on each flight in order to break even. Estimates generated by the Air Transport Association indicate that in the late 1990s airlines needed a load factor of 65 percent to break even. (See chart 9.)<sup>37</sup> At the time the industry was averaging a load factor of around 70 percent, allowing airlines to profit despite excess capacity. However, from 2000 to 2002, rising fuel prices pushed the industry’s average breakeven point up 20 percentage points. Unable to boost their load factors, the airlines faced soaring losses. The gap between the breakeven load factor and the actual load factor reached its widest point in 2002 and then narrowed over the next 2 years as airlines streamlined operations and raised actual load factors to more than 75 percent. However, the narrowing proved to be short lived, because the rise in fuel prices continued unabated.

**Chart 8. Index of jet fuel prices, seasonally adjusted, 1986–2008**

SOURCE: Bureau of Labor Statistics Producer Price Index.

**Chart 9. U.S. passenger airline industry load factor, four-quarter moving average, 1990–2007**

SOURCE: Air Transport Association.

With airlines stymied in their attempts to raise prices to cover surging fuel expenditures, airlines continued to focus on cutting costs instead. As a result, airlines dropped unprofitable routes and attempted to reduce expenditures on their remaining routes. The industry also made strides toward reducing its fuel consumption. Many airlines have tried to reduce the weight of their airplanes and thereby raise fuel efficiency standards. Despite the industry's efforts to conserve fuel, fuel consumption can only be reduced so much, particularly in the short term.

Because of their limited ability to curtail fuel expenses, airlines have had to look to other areas to reduce expenses. Labor, being a major portion of any airline's expense, has borne the brunt of these cost-saving efforts. Unlike jet fuel—a resource for which airlines have no alternative—capital is a resource that can sometimes be substituted for labor. Advances in information technology have made it possible to automate many previously labor-intensive processes. Functions such as reservations and passenger check-in can now be handled electronically. In addition, many airlines have made greater use of outsourcing to handle jobs such as routine maintenance. During the 4 years following 2001, the industry experienced a dramatic fall in unit labor costs as labor productivity rose by almost 50 percent. (See chart 10.)<sup>38</sup>

With the demand for labor in the airline industry decreasing, airlines have been able to reduce wages and increase work requirements. After 2001, efforts to reduce labor costs have been a major point of contention in airline contract negotiations. Recognizing the industry's fiscal situation, employees have generally been willing to accept pay cuts in exchange for continued employment. In addition to outright reductions in earnings, early retirement programs have also become commonplace across the industry. Because of turnover in the labor force, airlines have been able to replace experienced, higher-salaried employees with less experienced and thus less costly employees. Anecdotal reports indicate that the industry's starting salaries are lower than they were prior to 2001.<sup>39</sup> From 2001 to 2005, real weekly earnings in the industry fell by 8.3 percent. (See chart 11.)<sup>40</sup>

### Brief signs of a recovery

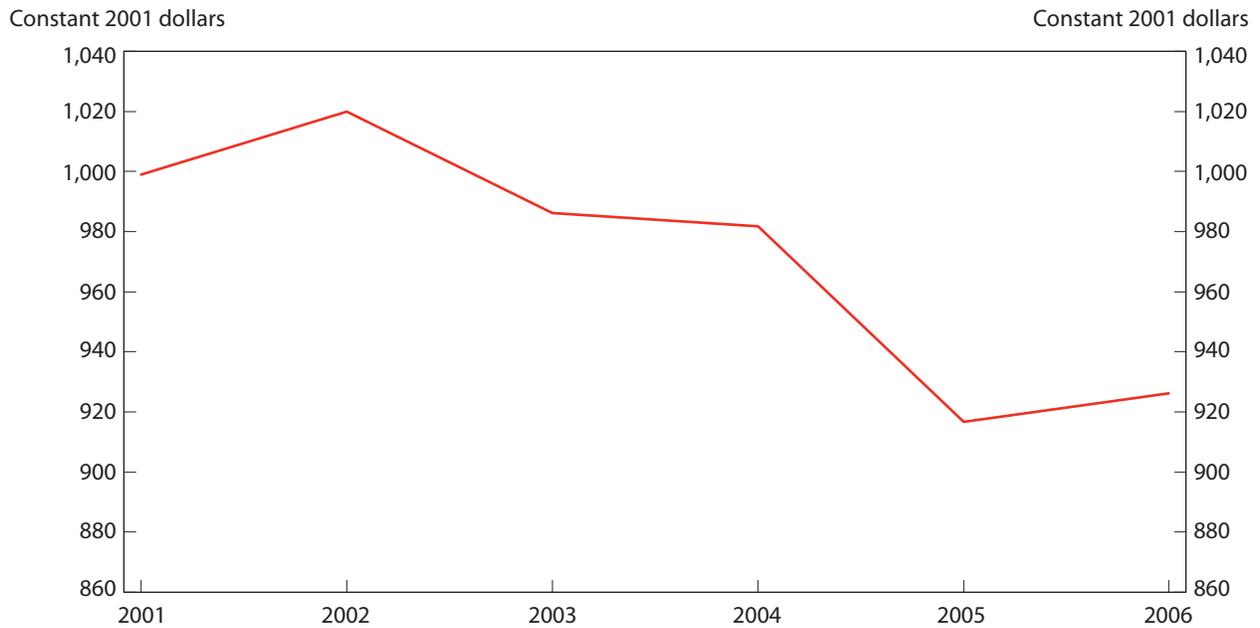

By 2006, airline industry employment began to show signs of recovering after several negative years. (See chart 12.) Passenger volumes stood at record levels, and the industry continued to make progress on structural reforms. Airlines were also successful in raising ticket prices for the first time in several years. Consequently, financial losses

**Chart 12. Air transportation employment, seasonally adjusted, 2000–08**

subsided, and many airlines recorded their first profits since 2000. Because of the gradually improving health of the airline industry, employment losses in the industry finally ended. After losing jobs for 5 of the 6 previous years, air transportation employment leveled off in early 2006. Airlines had completed most of their major layoffs yet remained hesitant to take on new personnel; accordingly, employment stagnated throughout the year. In February 2007, air transportation employment officially reached an employment trough. Although the airline industry had shed nearly one in four workers during the previous 6 years, the steady downward trend in air transportation employment had ended.

However, the respite did not last long. Despite modest employment growth in 2007, the industry once again experienced turbulence caused primarily by fuel prices that began to accelerate during the second half of 2007. By 2008, the industry's troubles were compounded by a slowing national economy. The anemic recovery in employment that had begun in early 2007 gave way to further job losses. In February 2008, the industry officially reached another employment peak after having recovered only a little over one-seventh of the jobs lost during the previous decline. By the middle of 2008, the industry had entered

another period of sustained employment declines because of a bleaker outlook for air travel resulting from rising fuel prices and a weakening economy.

THE AIRLINE INDUSTRY HAS RECENTLY EXPERIENCED its most volatile period in the past 20 years. Propelled by expectations of ever-increasing demand for air transportation, passenger airlines expanded rapidly throughout the late 1990s. The growth was led by discount carriers that possessed distinct competitive advantages over their more established rivals. When the economy faltered in 2001, it became apparent that air carriers had expanded beyond sustainable levels. The September 11th attacks contributed to a further decline in the industry. Over the course of the next 5 years, airlines continued to struggle as fuel prices rose to historic highs. Even after passenger volume recovered, the airlines continued to shed jobs in an attempt to restructure and return to profitability. In early 2007 employment in air transportation reached a trough, and airlines returned to profitability, carrying record numbers of passengers. However, the recovery in airline employment would prove to be short lived. By 2008, the industry was once again losing jobs because of soaring fuel prices and a faltering national economy. □

## Notes

<sup>1</sup> The data on employment used in this article are from the Current Employment Statistics (CES) program, which surveys 150,000 nonfarm businesses representing about 390,000 worksites monthly. For more information on the program's concepts and methodology, see Current Employment Statistics Technical Notes, on the BLS Web site at <http://www.bls.gov/ces/#technical> (visited Oct. 6, 2008). CES data are available at [www.bls.gov/ces](http://www.bls.gov/ces) (visited Oct. 7, 2008). Data used in this article are seasonally adjusted unless otherwise noted.

<sup>2</sup> As measured by revenue passenger miles, which is roughly the number of tickets sold times the average mile per ticket sold.

<sup>3</sup> Data in this article regarding airline employment refer to "air transportation" (NAICS 481), unless otherwise noted. The industry is composed of both "scheduled" and "nonscheduled" airline employment. However, scheduled air transportation accounts for the bulk of total air transportation employment.

## Employment programs for recipients of unemployment insurance

*The Worker Profiling and Reemployment Services, Short-Time Compensation, and Self-Employment Assistance programs provide employment services exclusively to unemployment insurance beneficiaries; the history of each program, as well as its State-level implementation, is examined*

Stephen A. Wandner

**T**he Unemployment Insurance (UI) program is an income support program that was established in 1935 as part of the social insurance safety net provided by the Social Security Act. The program pays temporary benefits to workers who become unemployed through no fault of their own. It also promotes economic stability by maintaining purchasing power. Federal law provides the framework under which State UI programs operate. State UI programs pay out benefits and collect taxes. States pay benefits to workers who are eligible for them under their own State UI laws. States also pay out benefits under Federal benefit programs that are responsible for unemployment compensation for Federal employees and ex-service members, trade adjustment assistance, and disaster unemployment assistance.

The UI program has a companion purpose: to help unemployed workers return to productive employment. Able-bodied UI beneficiaries are required to search for work, register for work, and receive reemployment services at one-stop career centers throughout the United States. In some States, they are required to participate in eligibility reviews that have a reemployment component. As permanent layoffs have become more prevalent and unemployment durations for UI beneficiaries increased in recent decades, helping the unemployed return to work has become more

important. During this same period, three employment programs have emerged within the UI program that focus exclusively on the reemployment of UI beneficiaries: the Short-Time Compensation (STC) program, enacted in 1982; the Worker Profiling and Reemployment Services (WPRS) program, enacted in 1993; and the Self-Employment Assistance (SEA) program, also enacted in 1993. These programs have become a part of Federal and State UI laws, and they operate within the UI program.

In each year from 2001 to 2007, the UI program paid between \$31 billion and \$54 billion to between 7 and 10 million beneficiaries. It is projected to pay out between \$30 billion and \$45 billion to approximately 8 million beneficiaries in each of the next 5 years. By contrast, the STC and SEA programs pay small amounts of benefits to small numbers of workers. (However, the STC program plays a significant role in a small number of participating States in times of recession.)

Some States have elected to pay STC and SEA benefits out of their UI trust fund accounts, as is permitted by Federal law. Because STC and SEA are a part of the UI program, participants in those two programs should be counted in measuring all UI program beneficiaries, weeks of benefits claimed, and benefits paid.<sup>1</sup>

WPRS is a much larger program that provides reemployment services to the approxi-

mately 1 million UI claimants identified as likely to exhaust their benefits and who are referred to services each year. Such reemployment services have been tested in the past and have been shown to speed the return to work of UI claimants and, hence, reduce the duration of insured unemployment.

Other industrial nations also are concerned with reducing unemployment by means of reemployment programs. The Organization for Economic Cooperation and Development (OECD) distinguishes between *active* labor market programs, which provide reemployment services and other support that can help return unemployed workers to productive employment, and *passive* labor market programs, which include income support programs such as UI. For its first 40 years, the U.S. UI program was almost exclusively a passive labor market program, paying benefits and collecting employer taxes to pay for those benefits. It did not provide reemployment services or incentives that help unemployed workers return to work or try to avoid unemployment.

### Worker Profiling and Reemployment Services

In the mid-1980s, the U.S. Department of Labor conducted a social science experiment in New Jersey that tested the effect of providing an in-depth program of job search assistance to permanently separated unemployed workers who were collecting UI benefits. A rigorous evaluation using randomly assigned treatment and control groups found that reemployment services reduced the duration of insured unemployment by between half a week and a week for UI recipients who were offered those services. A cost-benefit analysis found that the provision of enhanced job search assistance was cost effective to the Department of Labor, to the Federal Government, and to society as a whole.<sup>2</sup> These findings were incorporated into the Reemployment Services component of WPRS.

The other WPRS component is Worker Profiling, a process that makes serving permanently dislocated UI beneficiaries more effective and efficient by providing a targeting mechanism for reemployment services. WPRS automates the targeting, or sorting, of 8 to 10 million UI beneficiaries each year, to determine which ones need help finding a job. Not all of these workers need reemployment services, nor do States have sufficient non-UI (for example, Wagner-Peysers Act) funds to serve them all. If reemployment services are going to be provided to some UI beneficiaries, a mechanism is needed to identify those who are likely to be most in need of such services. WPRS provides that mechanism.

There is a close relation between UI beneficiaries referred

by WPRS and the population of long-tenured dislocated workers. Biennial BLS surveys of these displaced workers show that between two-fifths and three-quarters of them collect UI benefits. The percentage is higher in recessionary periods, and at all times the percentage is higher still when those displaced workers who are unemployed less than 5 weeks—and therefore less likely to apply for UI benefits—are excluded.<sup>3</sup> For example, between 1984 and 1988, 62 percent of all displaced workers received unemployment benefits, but among displaced workers who were unemployed 5 weeks or longer, the proportion increased to 81 percent.<sup>4</sup>

On the basis of these findings, the WPRS program was enacted in 1993 as an amendment to the Social Security Act, at section 302(j). Section 302 requires that all States establish WPRS systems and that these systems identify UI claimants who are “likely to exhaust regular compensation”<sup>5</sup> and who need “job search assistance services to make a successful transition to new employment.” WPRS systems also must refer the workers to reemployment services to the extent that those services can be provided with funding under existing State and Federal laws. In other words, because no new funding was made available for WPRS, States were required to fund the aforementioned services from existing grants or appropriations.<sup>6</sup>

UI claimants who are found to be likely to exhaust their benefits and who are referred to reemployment services are required to participate in those services. Most States have chosen to conduct a worker profiling process that uses a statistical method to identify those workers who are likely to exhaust their benefits.<sup>7</sup> Depending on the availability of funds to provide reemployment services, the State UI agency refers a specified number of new UI claimants to local one-stop career centers each week.

After Federal legislation was enacted, the Department of Labor provided technical assistance to States in developing statistical profiling models and in implementing their programs of reemployment services. States began implementing WPRS programs in late 1993, and programs were operational in all states by mid-1996. As a result, there is a dozen years of national experience with this Federal program.

Under WPRS, reemployment services are divided into six categories: orientation, assessment, counseling, placement services, a job search workshop, and referral to training.<sup>8</sup> All States report their participation in the WPRS program and in these six categories of services in quarterly reports to the Department of Labor.

Worker participation in the WPRS system depends on the weekly flow of new UI claimants being profiled, gener-

ally when they receive their first benefit payment. The statistical profiling mechanism places all profiled workers in an array according to their likelihood of exhausting their UI benefit entitlement. First, UI claimants are referred to reemployment services at one-stop career centers to the extent that funds are available to provide those services. Claimants who are most likely to exhaust their benefits are selected, and they then report to the centers to receive services. The specific services provided depend on the needs of the workers, as well as the policies of the State workforce agency and of the local officials who operate the individual centers.<sup>9</sup>

The extent of participation in the WPRS system has changed over time, and reported participation is summarized in table 1. Since 1996, between 845,000 and 1.1 million UI beneficiaries have reported annually to the one-stop career centers, except in 2001 and 2002, when the recession raised the number to 1.2 and 1.5 million, respectively.<sup>10</sup> The table shows that WPRS is a highly countercyclical system. In 2001, the U.S. was in a recession,

and the number of unemployed workers participating in the UI program reached a cyclical high, as did the number of participants in the WPRS system. The number of UI claimants profiled, referred to reemployment services, and reporting for those services reached a peak in 2001 and 2002.<sup>11</sup>

From 1996, when WPRS was fully operational in all States, through 2002, more than 90 percent of workers receiving a first payment were profiled in order to determine their likelihood of exhaustion of benefits.<sup>12</sup> The percentage profiled has declined to between 80 percent and 90 percent in the period from 2003 through 2007. The number of UI beneficiaries who were profiled also declined cyclically, from 2002 through 2007. Nevertheless, WPRS remains a substantial program, with the number of UI beneficiaries who were referred to WPRS remaining greater than 1 million from 2001 through 2007. These referrals remained high because the percentage of profiled workers who were referred to reemployment services increased to between 14 percent and 16 percent from 2005

<sup>1</sup> Key to column heads:

Beneficiaries Number of beneficiaries (first UI payments for new benefit years established).  
 Profiled Number of UI claimants profiled by State WPRS systems.  
 Referred Number of profiled claimants referred to reemployment services.  
 Reported Number of profiled and referred claimants who report for WPRS services.  
 Orientation Number of profiled and referred claimants who report to an orientation.  
 Assessment Number of profiled and referred claimants who report to an individual assessment.

Counseling Number of profiled and referred claimants who report to job counseling.  
 Placement Number of profiled and referred claimants who report to placement services.  
 JSW Number of profiled and referred claimants who report to a job search workshop.  
 Training Number of profiled and referred workers who are referred to government-funded education or training.

SOURCE: U.S. Department of Labor, Employment and Training Administration (ETA), Unemployment Insurance (UI) Data Base. UI first payment data are from ETA report no. 5-159. Worker Profiling and Reemployment Services (WPRS) data are from ETA report no. 9-048.

to 2007, after having remained mostly between 9 percent and 12 percent before then.

Because the State UI programs refer only as many UI claimants to WPRS services as are permitted by the availability of services at individual career centers, the referral rate represents the capacity of the program to serve profiled workers. This capacity has been quite steady over time. All of the referred workers receive one or more reemployment services. Although it cannot be determined how many of the six reported services each worker received, the average number of services provided per referred worker has been declining. For example, in 2001, UI beneficiaries referred to one-stop career centers received an average of 2.1 services per referred worker; the figure fell to 1.7 services per referred worker in 2007. In addition, the percentage of referred workers who receive each separate service generally has declined over time.

For individual reemployment services, the service that is most often provided to reporting workers is an orientation session. Today, between one-half and two-thirds of all referred workers receive an orientation, compared with about two-thirds at the beginning of the program. Placement services—trying to match UI claimants with job openings—are the second most used service, with more than one-third of those referred receiving placement services, although the provision of these services also has declined over time. The next two services in terms of their relative use are assessments and job search workshops. Only about one-tenth of those referred receive counseling, and referrals to counseling services have been declining both recently and as a long-term trend. Referrals to training have declined the most sharply of any service, from a high of more than 160,000 in 1996 to fewer than 100,000 in 2007, now representing less than one-tenth of all those referred for any service. Note that the more in-depth and expensive services—assessment and counseling, job search workshops, and training—are the least used services. Limited referral to reemployment services in general, and to more costly services in particular, has been related to limited funding for these core and intensive services provided under the Workforce Investment Act and Wagner-Peyser Act.

An evaluation of the WPRS system, completed for Connecticut, Illinois, Kentucky, Maine, New Jersey, and South Carolina in 1999, indicated that the system is more effective in States that provide in-depth services and enforced program participation. In 4 of the 6 States evaluated, WPRS had the expected impact on UI outcomes, reducing the receipt of UI benefits by one-quarter of a week to 1 full week and reducing the receipt of benefits by \$62 to \$140

per claimant. In the other 2 States, the evaluation found that UI effects were mixed or without impact and that in some States the provision of reemployment services was limited. As expected, in the 3 States with greater provision of reemployment services, the UI effects were correspondingly larger. UI effects also were greater in States with greater enforcement of participation in WPRS, as measured by UI administrative determinations and denials of benefits.<sup>13</sup>

Concern about targeting reemployment services to use the limited funds that are available is a common theme in many industrial nations other than the United States. The OECD became interested in this issue after the enactment of WPRS and in response to early interest in similar approaches in other nations.<sup>14</sup> More recently, a number of European Union member countries have come to use similar targeting approaches for a variety of purposes. Exhibit 1 presents information on programs making use of profiling in European Union countries. Most European Union countries use profiling methods to assign jobseekers to alternative “packages” of reemployment services.

### Short-Time Compensation

The STC (work-sharing) program began in Germany in the 1920s under the Weimar Republic. After World War II, it expanded to a number of other industrial nations. Under STC, employers can reduce work hours for more workers instead of laying off a smaller number of workers. For example, a firm that temporarily must reduce its wage bill by 20 percent could lay off 10 of its 50 workers. Under STC, it could retain these workers by instead reducing the workweek for all 50 employees by 1 day a week; in that case, the wage bill would decrease by the same amount, and all of the workers would be eligible to receive one-fifth of the weekly UI benefit amount they would have received if they had been totally unemployed.

Under STC legislation, both the employer and the workers must be willing to participate in the program. Participation may be advantageous to the employer, especially if the layoff is temporary and hiring costs are high. STC also is beneficial to the employees who would have been laid off, but the other workers must be willing to reduce their hours and have a small decrease in their weekly income. In the United States, STC is overwhelmingly used to reduce the workweek from 5 days to 4.

Although New York was the first State to consider enacting STC, the U.S. program actually began with the enactment of State legislation in California in 1978. Two other States—Arizona and Oregon—enacted programs

**Exhibit 1. Uses of profiling systems in selected industrial nations to identify unemployed workers who need services**

Australia	<p>In 2003, an Active Participation model replaced an earlier profiling approach. Jobseekers are classified as to their risk of becoming one of the long-term unemployed. (A higher risk entitles one to receive case management; a lower risk still entitles one to attend a job search workshop after 3 months of unemployment and to receive intensive customized assistance after 12 months.) Australia uses a Job Seeker Classification Instrument, a statistical diagnostic tool that assesses the risk of long-term unemployment as a function of 14 factors, including age, sex, work experience, and training.</p>	Hungary	<p>of vocational training, and in need of special attention for the long-term unemployed.</p>
Denmark	<p>In 2004, Denmark introduced the Job Barometer for use by placement officers to standardize the profiling process across the country. The Barometer is a statistical model that calculates the probability of finding employment within the next 6 months, on the basis of customer account information.</p>	Netherlands	<p>Beginning in 1999, a number of different approaches to profiling either were under development or had been developed and were in use. All of these approaches determined jobseekers' job search readiness and classified workers in order to assign them to receive different reemployment services packages.</p>
France	<p>Since 2001, jobseekers have been assigned to 1 of 7 groups that determine the type of services provided to them. A profiling mechanism is used to assign jobseekers to the appropriate group.</p>	Switzerland	<p>On the basis of jobseeker characteristics, a Statistically Assisted Program Selection tool identifies programs of reemployment services that have proved to be most cost effective for individuals. The tool was tested as a demonstration project in 16 regional agencies, and the results were compared with those obtained for a control group.</p>
Germany	<p>A classification tool uses individual data, including data on sex, age, and job experience, to assign each jobless worker to one of four categories of need for reemployment services: none, in need of job search assistance, in need</p>	United Kingdom	<p>For the Job Search First strategy, statistical models were tested to estimate the probability of rapid reemployment and to model the most efficient forms of assistance for jobseekers in the provision of reemployment services.</p>

before the Congress enacted a temporary national program in 1982. That program was made permanent in 1992, and States were permitted to adopt their own STC programs as part of their State UI laws.<sup>15</sup>

Under section 303(a)(5) of the Social Security Act, the Unemployment Trust Fund can pay for STC. Each State has an account within the Fund from which it pays UI benefits. The Act defines STC as a UI program; States then have the option to use a portion of the funds in their Unemployment Trust Fund account to pay for STC benefits. At

present, 17 States have STC provisions in their UI laws.

Table 2 illustrates the fact that STC is a small program. Since 1990, STC benefits have been paid to between only 33,000 and 123,000 workers covered by the UI system. These beneficiaries represent between 0.4 percent and 1.3 percent of regular UI beneficiaries.

Although the STC program is very small nationally, it operates as a highly countercyclical program. In recessions, the number of STC beneficiaries who receive their first payments rises sharply as a percentage of regular UI ben-

eficiaries who receive their first payments. The percentage rose to 0.9 percent in 1991 and 1.1 percent in 1992 and again rose to 1.2 percent in 2001, declining to 0.9 percent in 2002 and 0.8 percent in 2003. The percentage has remained between 0.4 percent and 0.9 percent in all other years since the late 1980s, when the program became established in a substantial number of the 17 States that have implemented STC programs.<sup>16</sup>

STC has been a much more important component of the UI program in the few States in which the program is fully operational. Table 3 shows that, whereas STC beneficiaries were 1.1 percent of all UI beneficiaries in the United States in 2001, most States did not have STC programs. However, for the seven States that made the greatest use of the program that year, work sharing was much more important, serving more than 3.0 percent of all UI beneficiaries.<sup>17</sup> Thus, STC is popular among both employers and employees in a small number of States. In approximately a

dozen States with STC programs, employers consistently make use of the program in both periods of low and periods of high unemployment. The other STC States make only limited use of the program.

Today, STC programs exist in a number of industrialized countries. The European Union collects data on labor market programs, including STC. Data for 2004 show STC programs operating in six European Union countries: Austria, Belgium, Finland, Germany, Luxembourg, and Spain. (See table 4.) STC participants account for anywhere from less than 1 percent of participants in a country’s basic UI program up to nearly 15 percent. The programs in Finland and Germany are bigger than any U.S. State’s program, but the programs in Austria, Belgium, Luxembourg, and Spain are roughly similar in size to the U.S. programs. STC programs have declined in Europe with the spread of “flexicurity,” a flexible labor market policy offset by a strong social safety net.

The last U.S. evaluation of STC was published in 1997.<sup>18</sup> The evaluation found that employer participation was low, but that employers who used the program generally were satisfied with it. Still, even among firms that had used STC, layoffs remained the primary method of reducing the workforce. The program was not found to threaten the solvency of the State UI trust fund accounts, because STC benefits were paid for largely by employers participating in the program. Administrative costs of the STC program were found to be similar to the cost of administering the regular UI program when States had automated and streamlined the payment process.

### Self-Employment Assistance

The UI program in the United States requires workers to search for wage and salary jobs each week. The Self-Employment Assistance (SEA) program, by contrast, waives the State UI work search requirement for UI claimants who are working full time to establish their own small businesses, instead providing them with a weekly SEA allowance. The allowance is in the same amount, and is available for the same duration, as regular UI benefits. Participants must meet other eligibility conditions in order to receive those benefits, but they do not have to be actively searching for wage and salary jobs.

The U.S. Department of Labor based the design for the SEA program on the results of two social science experiments that it conducted, both providing self-employment assistance to UI claimants in lieu of having them receive UI benefits. These experiments followed two different approaches to providing SEA: one, modeled on the program

**Table 3. Short-time compensation: State legislation and STC first payments as a percentage of regular UI first payments, 1997, 2001, 2005, and 2007**

<sup>1</sup> Continues to have an STC program, but has stopped reporting on it.

<sup>2</sup> Reports other STC activity, but generally does not report first payments.

NOTE: The Louisiana program was enacted in 1986, but was allowed to expire. Illinois enacted a program in 1983, but allowed it to expire in 1988.

North Dakota enacted a program that was available to one firm in 2006, but was allowed to expire.

SOURCE: U.S. Department of Labor, Employment and Training Administration, Unemployment Insurance Data Base. Data are from ETA report no. 5-159.

then in use in the United Kingdom, made periodic payments to participants; the other, modeled on the French program, gave participants one lump-sum payment. The two models were tested in different States, and the British model was found to be cost effective. With respect to self-employment and wage and salary outcomes, this program led to a statistically significant increase in the likelihood of workers finding and retaining employment, as evidenced by a large and statistically significant increase (\$5,940) in the workers' total annual earnings. The demonstration project found the British SEA program model cost effective from the perspectives of the U.S. Department of Labor, the entire Federal Government sector, and society in general.<sup>19</sup> Because of this strong positive outcome, the demonstration model was used to develop the Federal program enacted in late 1993.

SEA became a permitted use for making expenditures from the Unemployment Trust Fund under section 303(a)(5) of the Social Security Act. The Federal Unemployment Tax Act also was amended to define the SEA program at section 3306(t). As a result, States have the option to participate in the SEA program, and at present,

nine States—Delaware, California, Louisiana, Maine, Maryland, New Jersey, New York, Oregon, and Pennsylvania—have SEA legislation.<sup>20</sup>

The SEA program is available only to permanently separated workers who are likely to exhaust their entitlement to UI benefits. The mechanism for making a determination of exhaustion of benefits is the same worker profiling mechanism used to identify UI claimants who are referred to WPRS.

Table 5 presents data on the number of individuals entering the SEA program. The data reveal that the program is very small, reaching only 3,170 participants in 2002 and declining sharply since then. Even among the SEA states, the program is highly concentrated, with just seven States appearing to have had active programs in 2007. Five programs report having more than 100 participants that year, and none of the programs had as many as 1,000 participants. A number of States, however, have active microenterprise programs that are not tied to the UI program. States sometimes find that their own programs are more flexible and easier to implement than the Federal program.

SEA participants represented less than 1 percent of UI

NOTE: Dash indicates no program in place.

The measure of participants used in this table depends on the availability of data to the European Union. The “stock” (S), a measure of participants as an annual average stock, was generally used, because it is more frequently available. In some cases, the stock measure was not available (or was unreasonably small), so the number of “entrants” (E), or participants joining the measure during the year (also called the “inflow”), was used.

Unemployment insurance consists of “full unemployment benefits” (line 8.1 in the European Union report that is the source of the data for this table), which are considered to be unemployment insurance rather than unemployment assistance programs or other means-tested programs.

Short-time compensation (STC) is short-time work or partial unemployment benefits (line 8.2 in the European Union report), where “short-time

work” is the name for STC in Europe. Line 8.2 includes compensation for formal short-time working arrangements or for intermittent work schedules, irrespective of their cause, and during which the employer-employee relationship continues.

“Startup incentives” is the name used for self-employment assistance programs in Europe. Data on these programs include the amounts of loans or grants provided to individuals (line 7 in the European Union report).

STC and startup incentives include only transfers paid to individuals, not to employers.

SOURCE: *European Social Statistics: Labour Market Policy Expenditures and Participants: Data 2004* (Luxembourg, European Commission, Eurostat, Office for Official Publications of the European Communities, 2006).

beneficiaries in all States except Maine in 2004 and 2005. Maine’s STC participants represented 1.5 percent of regular UI beneficiaries in 2004. In other States, the maximum has been much less than 1 percent: 0.3 percent in Maryland, 0.3 percent in New Jersey, 0.6 percent in New York, 0.2 percent in Oregon, and 0.1 percent in Pennsylvania, for example. For the United States as a whole, SEA participation has reached only .0007, or less than one-tenth of 1.0 percent of regular UI beneficiaries.

After being profiled, some UI claimants are referred, and report, to a one-stop career center to receive reemployment services. A small proportion of UI claimants reporting for WPRS services are referred to the SEA program, and referrals are made only in States with such programs. Of the 7 states with active SEA programs, 4—Maine, New Jersey, New York, and Oregon—report that they use the WPRS system to identify individuals to refer to the SEA programs. (See table 6.) These referrals,

however, numbered 4,950 in 2002 and have been less than 2,000 in recent years.

Because States must use the worker profiling mechanism as the basis for referring workers to, and enrolling them in, SEA, the State reports to the U.S. Department of Labor are expected to show that workers who are enrolled in SEA generally are referred to the program through the profiling process. The WPRS reports, however, reveal that few States are using, or at least reporting, SEA referrals through the WPRS process. Only New Jersey reports that SEA referrals regularly occur before workers are enrolled in the program. Maine, New York, and Oregon report using the referral mechanism to some extent, while Delaware, Louisiana, Maryland, Minnesota, and Pennsylvania do not at all report using it. It is likely that States are underreporting (or not reporting) referrals to SEA.

Like the STC program, SEA programs began in Europe. There, and in a number of English-speaking countries

<sup>1</sup> Program enacted, but no data reported.

<sup>2</sup> Program not active.

NOTE: Dash indicates no program in place.

The States listed in this table are the nine States that have enacted permanent or temporary SEA legislation and implemented it in their programs. California enacted a program, but never implemented it. The permanent Minnesota SEA law became effective on April 19, 1995, but was repealed effective January 1, 1999. Minnesota did not implement its permanent program under SEA; instead, it implemented a temporary law that allowed the State to participate in a Department of Labor-sponsored self-employment demonstration project (Project GATE) that operated during the 2003–05 period (personal communication from

Charles Hartfiel, Minnesota UI director, June 6, 2006). The Louisiana law became effective on January 1, 2005, but the State has not begun reporting under the program. Data for Puerto Rico for 2001 have been removed, because the Commonwealth has not enacted a SEA program, although it did report data for 1 year. Maryland submitted erroneous data: SEA reported 571 participants in the past 5 years, but the number of participants actually has been between 100 and 200 per year. The number of participants in 2001 is estimated to be 125, whereas the number submitted was 4,227 (personal communication from Susan Bass, Maryland SEA director, June 9, 2008).

SOURCE: U.S. Department of Labor, Employment and Training Administration, Unemployment Insurance Data Base, ETA report no. 5–159.

other than the United States, SEA programs are more popular than the STC program. Indeed, many more of the European Union countries have SEA programs than have STC programs. The SEA program is popular with both the 15 older European Union countries and the newer members. SEA programs have been adopted by countries that were formerly part of the Soviet Union, not only to bolster employment and economic development, but also as a method of making the transition to a market economy. Of the 17 countries reporting SEA programs in 2004, participants represented only somewhat more than 2 percent of UI claimants in 10 countries and less than 1 percent in the other 7. If participation in the U.S. SEA program reached even just 1 or 2 percent of regular UI beneficiaries, and if the participants had an estimated 50 percent business start rates, the program could yield 50,000 to 100,000 business starts. At that level, SEA would have contributed an additional 8 percent to 15 percent of the 649,700 U.S. business starts in 2006.<sup>21</sup>

UNEMPLOYMENT INSURANCE IN THE UNITED STATES has adopted three programs to assist in the reemployment or maintenance of employment for UI recipients. WPRS is by far the largest of the three programs. While about a million UI recipients participate in State WPRS programs, the mix of reemployment services provided to participants in those programs is not as in-depth as occurred in the

New Jersey demonstration project. Compared with the New Jersey demonstration results, WPRS is likely to have a smaller, but still significant, effect in reducing the duration of insured unemployment.

The United States was an innovator in using WPRS to target resources to assist in reemploying workers. Because of widespread interest in reducing durations of insured unemployment and returning unemployed workers to productive employment, worker profiling methods are now used by a number of other industrial nations.

The STC program has been proven to be a useful labor market tool for employers and employees. This program was adopted by States in the 1980s and 1990s, and there is now substantial experience with its operations. In the United States, STC is a small program that is highly countercyclical, increasing substantially in recessionary periods in participating States. In a small number of States, STC participants are a small, but significant, proportion of UI recipients during recessions, reaching as high as 6 percent of UI recipients in 2001. STC operates in a handful of European Union countries as well.

In the United States, the SEA program is even smaller than the STC program. Even in those States which have SEA programs, the program is very small. Interest in SEA has declined sharply since 1998, when the Congress made the program permanent. By contrast, most of the European Union countries have SEA programs, and they are

<sup>1</sup> Program enacted, but no data reported.

NOTE: Dash indicates no program in place.

The States listed in this table are the nine States that have enacted SEA legislation and implemented it in their programs. Only four SEA States regularly submit SEA referral data. Data are excluded or missing as follows:

- California enacted, but never implemented, a SEA program; the State submitted SEA referral data only for 1996.
- SEA referral data were submitted for Connecticut from 1999 to 2003, for Georgia in 1997, for Iowa in 1995, for Nebraska in 1996 and from 1998 to 2004, for New Hampshire in 1996, for North Carolina in 2005, for Oklahoma in 2004, for Rhode Island in 2004 and 2005, for Utah in 2005, for Washington in 2002, and for West Virginia in 2007. These data were not listed in the table because none of these States enacted SEA programs.
- Louisiana submitted data for 1995, but the data were not listed in the table because the State had no SEA program at that time. Louisiana's new SEA program became effective January 2005, but no data were submitted from 2005 through 2007.

SOURCE: U.S. Department of Labor, Office of Workforce Security, Unemployment Insurance Data Base, ETA report no. 9–048.

larger than their U.S. counterparts.

European countries have a much different emphasis than the United States has when it comes to the SEA and STC programs. In the United States STC is much larger than SEA, whereas in Europe the opposite is

true. In Europe, SEA programs are seen as components of both national economic development policy and workforce development policy. The United States has not adopted SEA as a component of economic development policy. □

**Notes**

<sup>1</sup> For UI statistics, weeks compensated and benefits paid in the SEA program are included among measures of all UI programs, but the STC program has been excluded because it is part of a separate ETA report (no. 5–159) detailing UI claimant activity. This exclusion may have a significant effect on the count of UI claims in States than make greater use of the STC program.

<sup>2</sup> The evaluation of the New Jersey experiment was first reported in Walter Corson, Paul T. Decker, Shari Miller Dunstan, and Anne R. Gordon, *The New Jersey Unemployment Insurance Reemployment Demonstration Project: Final Evaluation Report*, Unemployment Insurance Occasional Paper 89–3 (U.S. Department of Labor, 1989). Two additional job search assistance experiments were conducted in Florida and the District of Columbia. (See Paul T. Decker, Daniel H. Klepinger, and Robert B. Olsen, *Assisting Unemployment Insurance Claimants: The Long-Term Impacts of the Job Search Assistance Demonstration*, Office of Workforce Security Occasional Paper 2000–02 (U.S. Department of Labor, 2000).)

<sup>3</sup> See Ryan Helwig, “Worker displacement in 1999–2000,” *Monthly Labor Review*, June 2004, pp. 54–68.

<sup>4</sup> This unpublished data on UI reciprocity by duration of unemployment was collected for the displaced worker survey through 1988, but has not been collected since then.

<sup>5</sup> Worker profiling is the process that determines which UI claimants are most likely to exhaust their entitlement to regular UI compensation.

<sup>6</sup> To partially fund job search assistance services to UI claimants participat-

ing in the WPRS system, the Federal budget provided approximately \$35 million a year to Wagner-Peyser Act programs for fiscal years 2001 through 2005.

<sup>7</sup> Forty-five States used statistical models for their WPRS programs in 2005. (See William F. Sullivan, Lisa Kolovich, Nicolas Louisos, Charles W. McGlew, and Douglas Sanford, *Worker Profiling and Reemployment Services: Evaluation of State Worker Profiling Models, Final Report* (unpublished manuscript, 2007).)

<sup>8</sup> Another WPRS service is referral of profiled workers to the SEA program, but that program is operative in only seven States.

<sup>9</sup> For a more detailed description of the WPRS program, see Stephen A. Wandner, “Early Reemployment for Dislocated Workers in the United States,” *International Social Security Review*, April 1997, pp. 95–112.

<sup>10</sup> Profiled UI beneficiaries generally receive a letter requesting them to report to a particular one-stop career center on a particular date. Because not all workers referred to WPRS actually report to receive services, the number referred should exceed the number reporting for services. A State-by-State analysis of WPRS reports, however, shows that 12 States had fewer referrals than those reporting, and 3 States—New Jersey, North Carolina, and Texas—accounted for most of the national difference. By 2007, only 4 States showed the number of those reporting greater than the number of those referred, and the differences were small.

<sup>11</sup> It is not clear how the number of UI beneficiaries reporting for WPRS services at the one-stop career centers was greater than the number who were referred to those services by the State UI program for the years 1996 through

2001. The number reporting would be expected to be equal to or less than the number referred.

<sup>12</sup> UI claimants who remain attached to their former employer, as determined by their having a definite recall date, or who find jobs through a union hiring hall are not subject to the worker profiling process and are not offered reemployment services under WPRS.

<sup>13</sup> Katherine P. Dickinson, Paul T. Decker, Suzanne D. Kreutzer, and Richard W. West, *Evaluation of Worker Profiling and Reemployment Services: Final Report* (Employment and Training Administration, 1999).

<sup>14</sup> See *Early Identification of Jobseekers at Risk of Long-Term Unemployment: The Role of Profiling* (Organization for Economic Cooperation and Development, 1998).

<sup>15</sup> The development of STC is discussed in David E. Balducchi and Stephen A. Wandner, "Work Sharing Policy: Power Sharing and Stalemate in American Federalism," *Publius: The Journal of American Federalism*, winter 2008, pp. 111–36.

<sup>16</sup> Programs in Illinois and Louisiana have lapsed.

<sup>17</sup> The seven States and the number of those participating in work sharing as a percentage of the number of beneficiaries served in the UI program in 2001 were Rhode Island (6.2 percent), Missouri (6.1 percent), Kansas (6.0

percent), Vermont (5.5 percent), Arizona (4.9 percent), Minnesota (3.4 percent), and California (3.2 percent).

<sup>18</sup> Steve Walsh, Stuart Kerachsky, Karen Needels, and Walter Corson, *Evaluation of Short-Time Compensation Programs: Final Report* (Employment and Training Administration, 1997).

<sup>19</sup> See Jacob M. Benus, Terry R. Johnson, Michelle Wood, Neelima Grover, and Theodore Shen, *Self-Employment Programs: A New Strategy: Final Impact Analysis of the Washington and Massachusetts Self-Employment Demonstrations* (Employment and Training Administration, December 1994).

<sup>20</sup> California has a law, but no program. Louisiana's program became effective in January 2005; however, the State does not currently operate its program. Minnesota's program has expired, and Maryland and Pennsylvania have had gaps in their reporting of SEA activity.

Pennsylvania's SEA program continues to operate. For the period from January through September 2006, the program had 201 participants who started 113 businesses. Those 113 businesses reported a combined gross income totaling \$228,239 and employed 19 workers earning \$260,373 in wages during that period (personal communication from Pete Cope, Director, Unemployment Compensation Benefits and Allowances, Pennsylvania, Jan. 25, 2007).

<sup>21</sup> See *The Small Business Economy, for Data Year 2006* (Small Business Administration, 2007).

## Union members in 2007: a visual essay

James A. Walker

Union membership data are eagerly anticipated each year by labor unions, economic researchers, business managers, and reporters. These annual average data from the Current Population Survey (CPS) have been available since 1983. The CPS is a survey of about 60,000 households that provides data on employment and unemployment among the Nation's civilian noninstitutional population age 16 and older. Additional data on union membership are available on the Internet at [www.bls.gov/cps/lfcharacteristics.htm#union](http://www.bls.gov/cps/lfcharacteristics.htm#union).

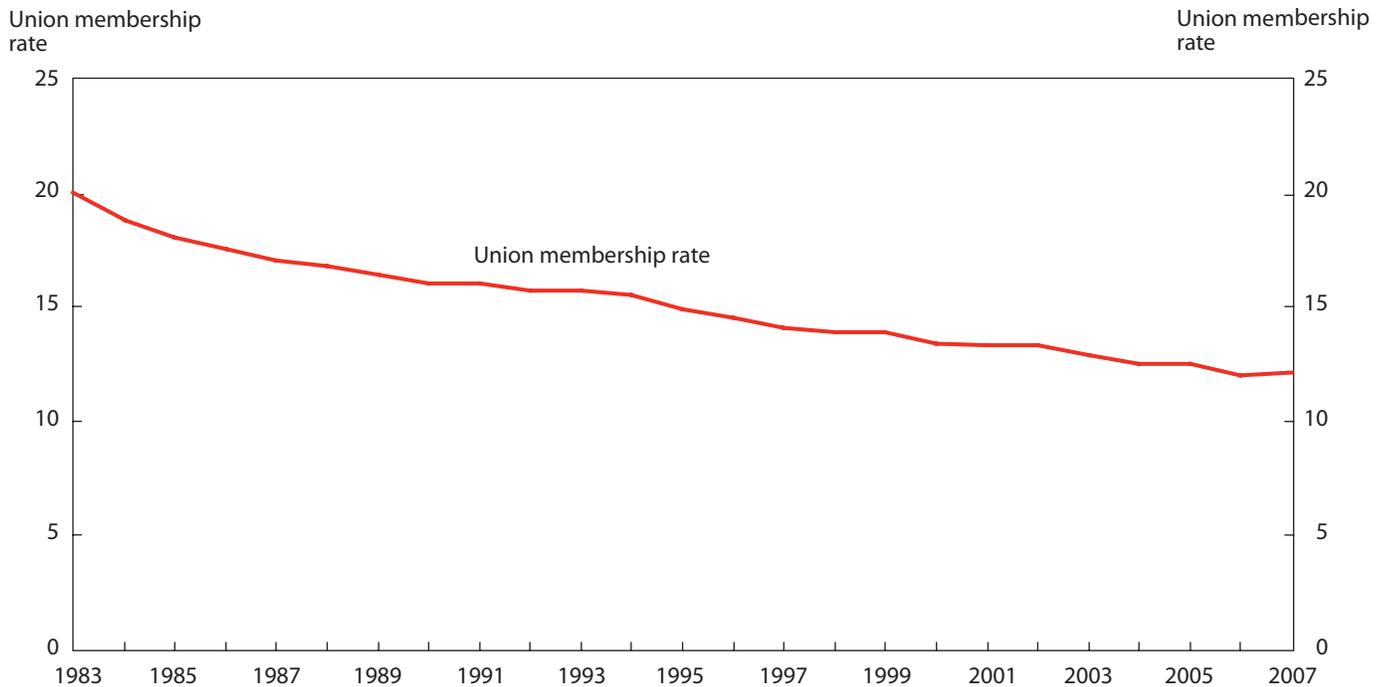

The term "union members" refers to members of a labor union or an employee association similar to a union. Nonunion employees are not members of a union, nor are they represented by a union on their job.

Data in this essay are limited to employed wage and salary workers. Union members who are temporarily absent from work because of strikes are included in the data. However, dues-paying union members who are unemployed or out of the labor force (such as those who are retired) are excluded.

Median usual weekly earnings data are for full-time wage and salary workers. The data represent earnings before taxes and other deductions and include any overtime pay, commissions, or tips usually received.

This essay was prepared by James A. Walker, an economist in the Division of Labor Force Statistics, Bureau of Labor Statistics. Phone: (202) 691-6378. E-mail: [Walker.James@bls.gov](mailto:Walker.James@bls.gov).

## 1. The union membership rate of employed wage and salary workers has declined since 1983

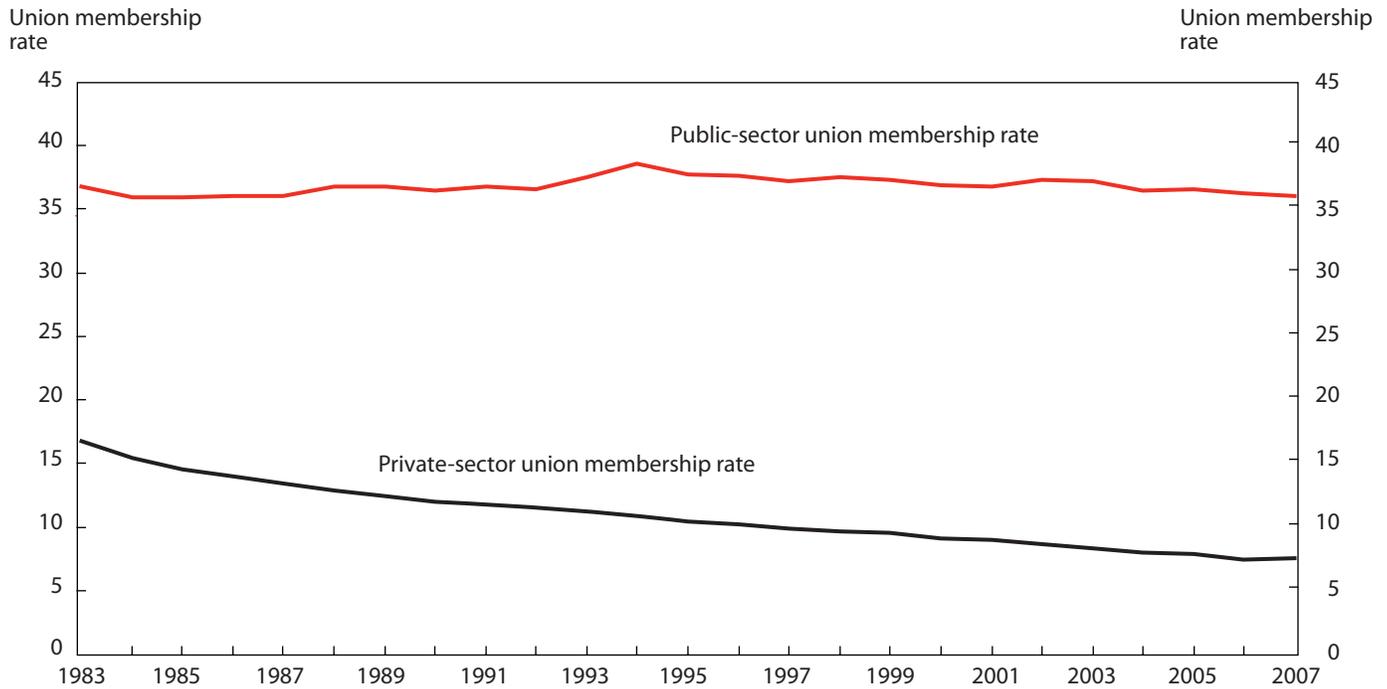

NOTE: The union membership rate is the proportion of wage and salary workers who are members of a union or an employee association similar to a union. Unpaid family workers and the self-employed are not included.

SOURCE: Current Population Survey (CPS), annual averages.

- The percentage of all wage and salary workers who are members of a union or similar organization has declined by 8.0 percentage points since 1983, the first year for which consistent union membership data are available. In 1983, the union membership rate was 20.1 percent; it fell to 12.1 percent by 2007.
- The overall number of union members declined from 17.7 million in 1983 to 15.7 million in 2007. This 2.0 million decrease in the number of union members occurred despite an increase of 41.5 million in the number of employed wage and salary workers in the United States over the same period.

## 2. The private sector had a lower union membership rate than the public sector, 1983–2007

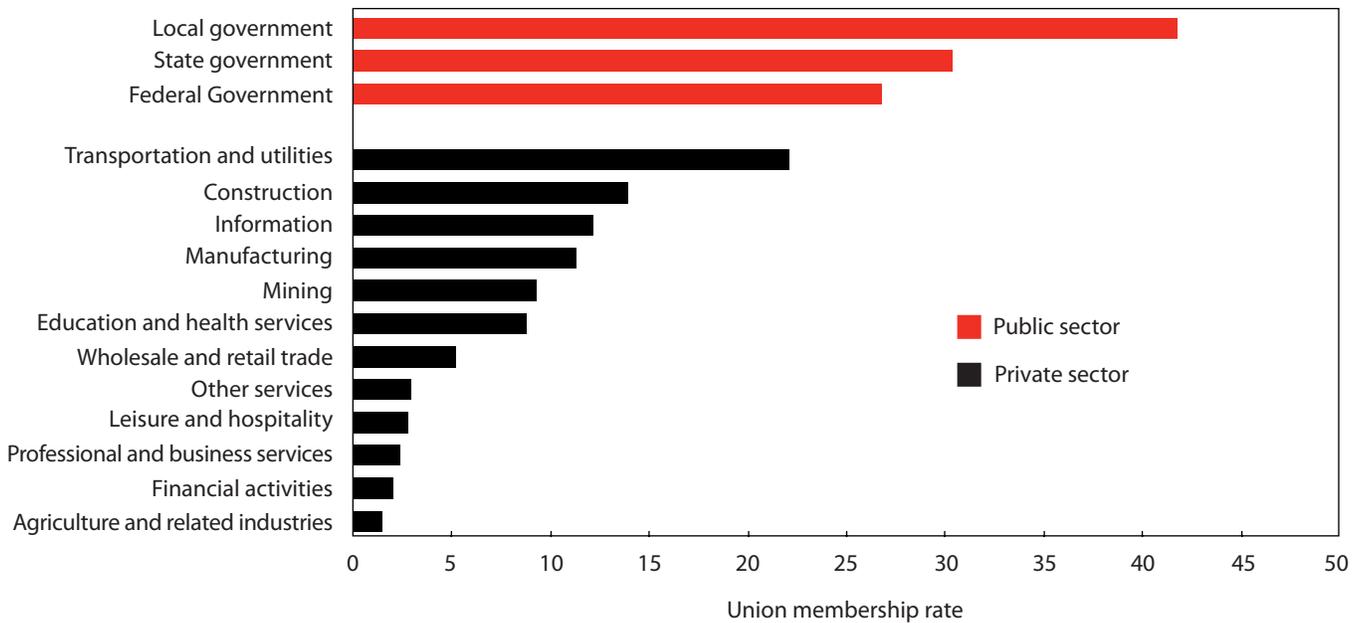

NOTE: Prior to 2000, private-sector data refer to the nonagricultural private sector.

SOURCE: Current Population Survey (CPS), annual averages.

- Private-sector employees have a lower union membership rate than public-sector (government) employees. In 2007, there was a 28.4-percentage-point difference between the unionization rates of these two groups.
- The private-sector union membership rate declined by 9.3 percentage points, from 16.8 percent in 1983 to 7.5 percent in 2007.
- In contrast, the union membership rate of the public sector changed little over the same period. In 1983, the union membership rate of the public sector was 36.7 percent; it was 35.9 percent in 2007.

### 3. Union membership rates varied by industry in 2007

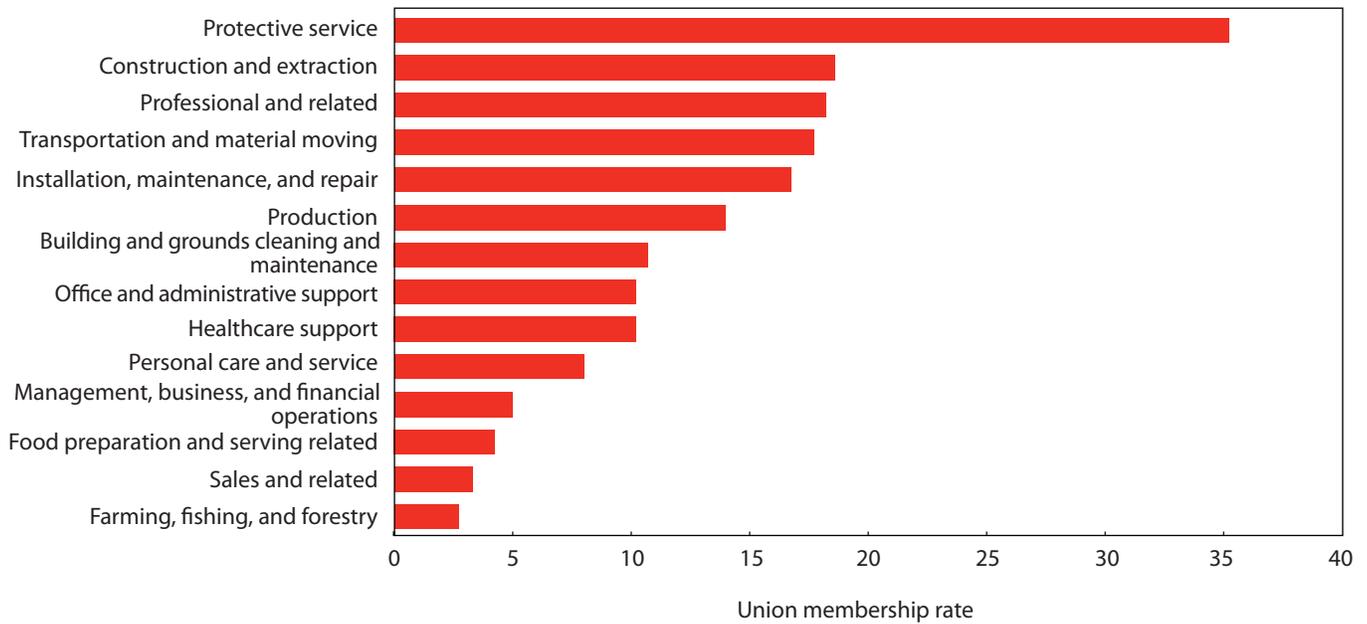

NOTE: Education and health services includes private education. Public education is included in the public sector.

SOURCE: Current Population Survey (CPS), annual averages.

- Within the public sector, local government had the highest union membership rate (41.8 percent), followed by State government (30.4 percent) and Federal Government (26.8 percent).
- Among private-sector industries, transportation and utilities had the highest union membership rate in 2007, at 22.1 percent. Agriculture and related industries had the lowest union membership rate (1.5 percent).

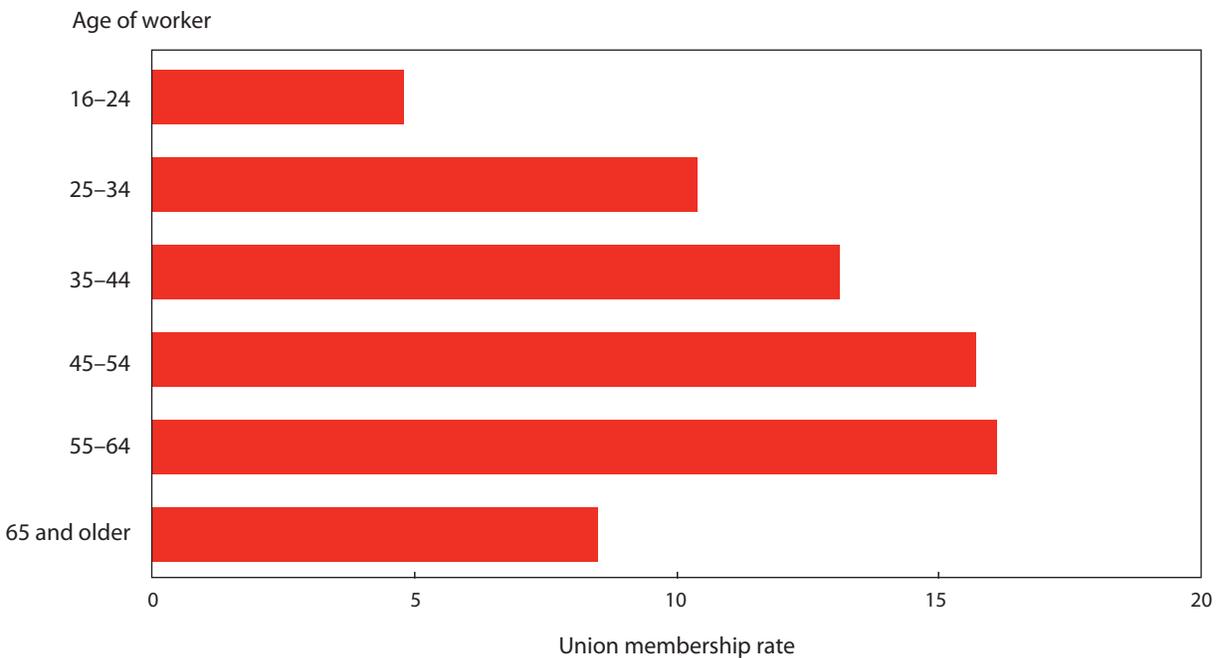

#### 4. Union membership rates differed by occupation in 2007

SOURCE: Current Population Survey (CPS), annual averages.

- In 2007, protective service occupations had the highest union membership rate among broad occupational groups, at 35.2 percent. This category includes police officers and firefighters in the public sector.
- Farming, fishing, and forestry occupations had the lowest union membership rate, at 2.7 percent in 2007.
- When the broad occupational groups shown in the chart were divided into more detailed occupational groups, education, training, and library occupations had the highest union membership rate in 2007, at 37.2 percent. Education, training, and library occupations (which include public school teachers) also accounted for the largest number of union members (3.1 million) in 2007. These occupations are included within the broad category of professional and related occupations shown in the chart.

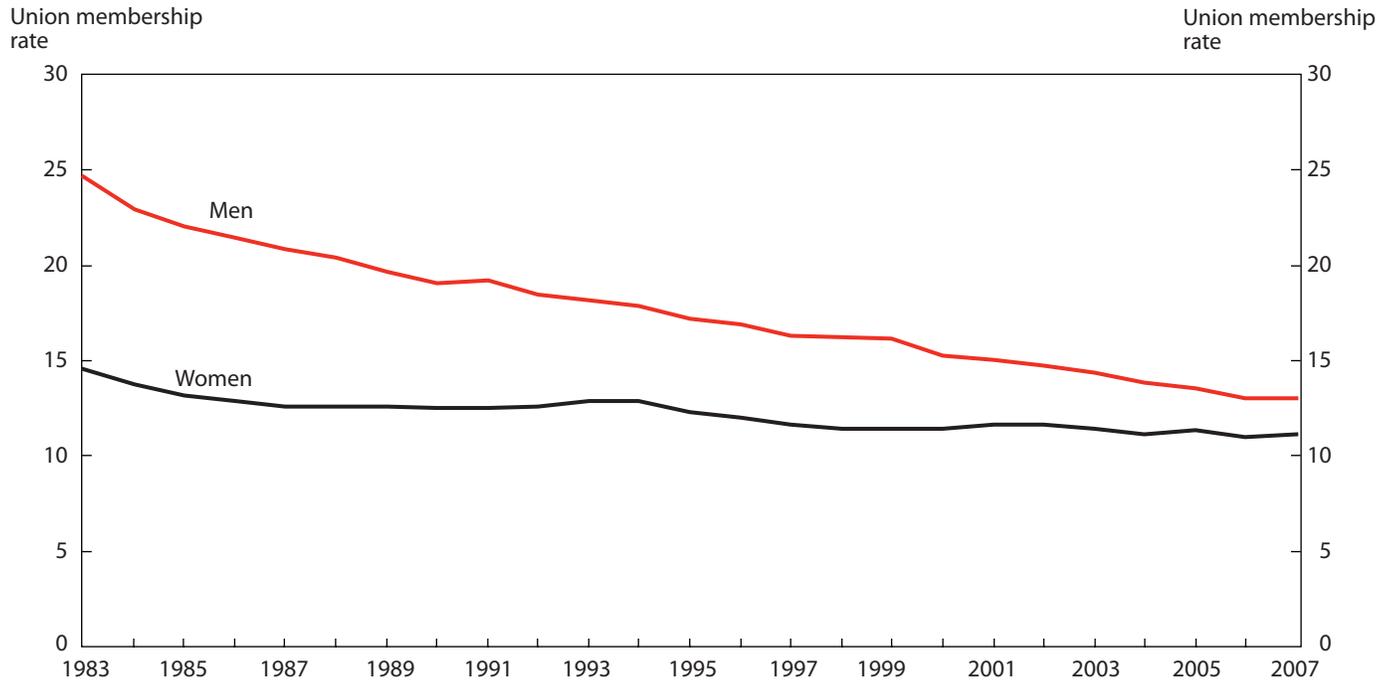

## 5. Wage and salary workers aged 45 to 64 years had the highest union membership rates in 2007

SOURCE: Current Population Survey (CPS), annual averages.

- In 2007, wage and salary workers aged 45 to 54 years and aged 55 to 64 years had union membership rates of 15.7 percent and 16.1 percent, respectively. Workers aged 16 to 24 years had the lowest rate (4.8 percent).
- At 8.5 percent in 2007, the union membership rate of wage and salary workers aged 65 years and older was about half that of workers aged 55 to 64 years (16.1 percent). The difference may be caused by larger proportions of union members retiring by age 65 than nonunion workers. Within education, training, and library occupations—a highly unionized field—42.3 percent of 55- to 64-year-olds in 2007 belonged to a union; by contrast, 20.2 percent of those aged 65 years and older were union members. Education, training, and library occupations had the highest union membership rate of both age groups in 2007.

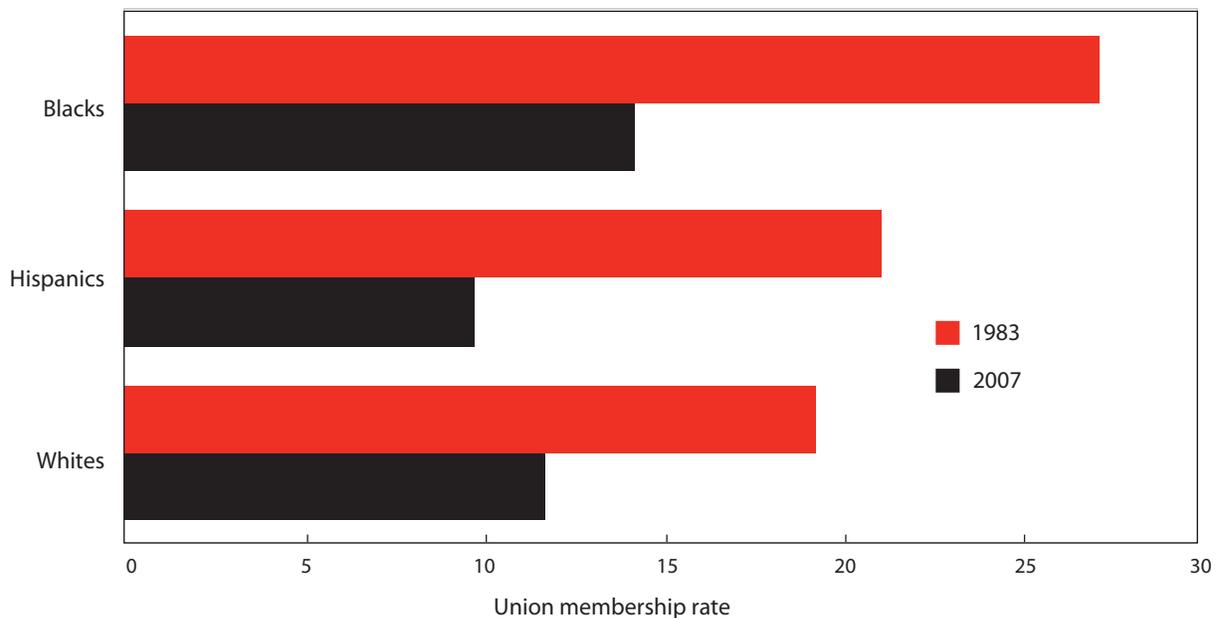

**6. The union membership rate for men was higher than the rate for women from 1983 to 2007, but the gap narrowed during this period**

SOURCE: Current Population Survey (CPS), annual averages.

- The gap between the union membership rates of men and women has narrowed considerably since 1983, when the rate for men was 10.1 percentage points higher than the rate for women. In 2007, the gap between men and women was 1.9 percentage points.
- In 1983, 24.7 percent of men were members of a union; by 2007, this rate had dropped by 11.7 percentage points to 13.0 percent. The decline in the union membership rate of women has been less pronounced than the decline in the men's rate. The unionization rate for women fell by 3.5 percentage points between 1983 and 2007, from 14.6 percent to 11.1 percent.

## 7. The decline in the union membership rate from 1983 to 2007 varied by race and ethnicity

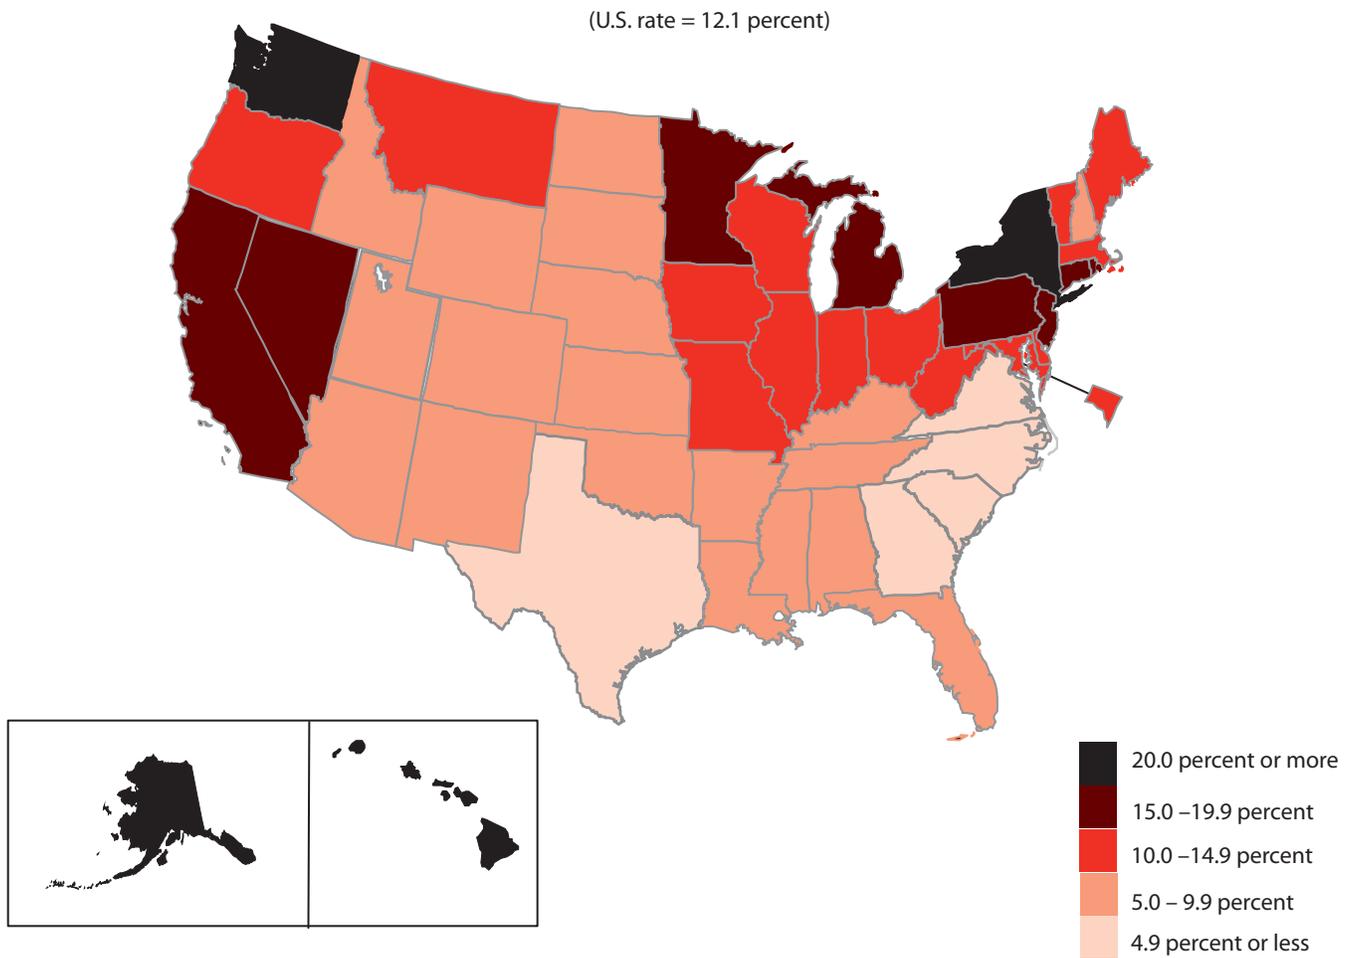

NOTE: The union membership rate of Asians is only available from 2003 onward; the rate was 10.9 percent in 2007. People of Hispanic ethnicity can be of any race.

SOURCE: Current Population Survey (CPS), annual averages.

- From 1983 to 2007, the decline in the union membership rate of Blacks (12.9 percentage points) and Hispanics (11.3 percentage points) was larger than the decline for Whites (7.5 percentage points).
- In 1983, Blacks had the highest union membership rate at 27.2 percent, followed by Hispanics (21.1 percent) and Whites (19.3 percent).
- In 2007, Blacks continued to have a higher unionization rate (14.3 percent) than Whites (11.8 percent), Asians (10.9 percent), and Hispanics (9.8 percent).

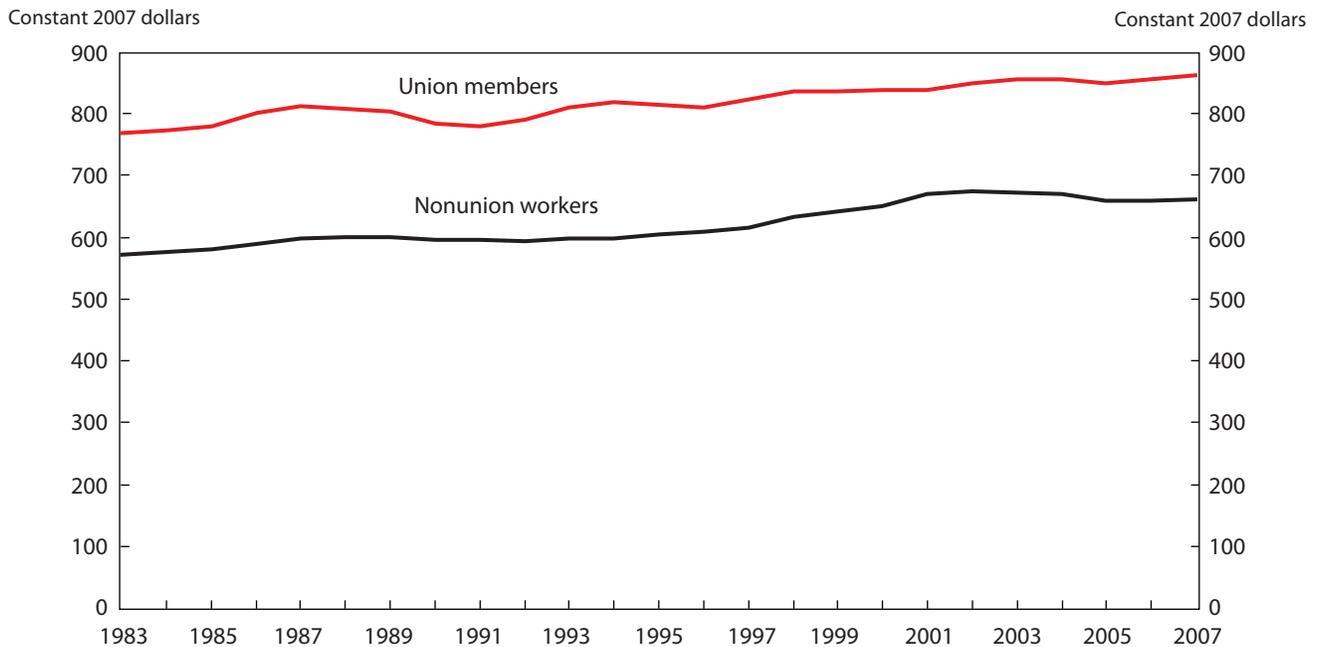

### 8. Only four States had union membership rates above 20 percent in 2007

SOURCE: Current Population Survey (CPS), annual averages.

- New York had the highest union membership rate in 2007 (25.2 percent), followed by Alaska (23.8 percent), Hawaii (23.4 percent), and Washington (20.2 percent). By comparison, in 1989, the first year for which union membership data by State are available from the U.S. Bureau of Labor Statistics, there were 12 States with union membership rates above 20 percent.
- Five States had union membership rates below 5.0 percent in 2007—Texas (4.7 percent), Georgia (4.4 percent), South Carolina (4.1 percent), Virginia (3.7 percent), and North Carolina (3.0 percent).

## 9. Among full-time workers, union members had higher weekly earnings than nonunion workers, 1983–2007

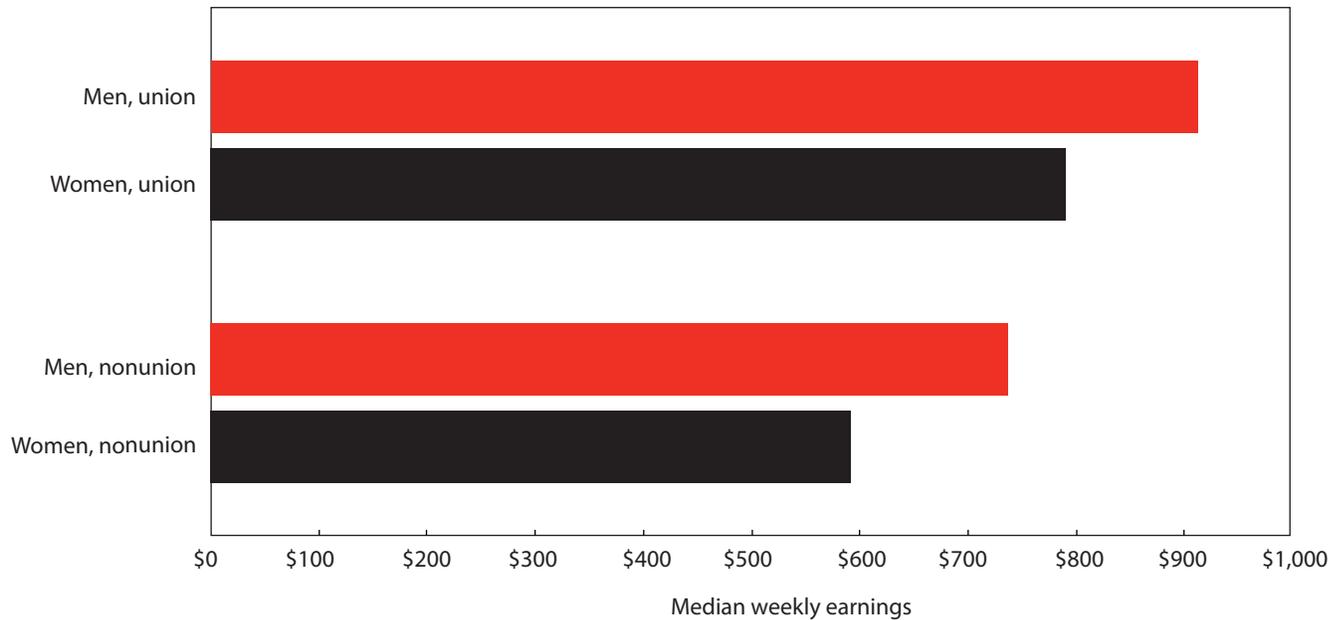

NOTE: The term “nonunion” refers to workers who are neither members of a union nor represented by a union on their job. Earnings are median usual weekly earnings of full-time wage and salary workers and have been converted to constant dollars using the Consumer Price Index research series (CPI-UR).

SOURCE: Current Population Survey (CPS), annual averages.

- In 2007, union members earned \$863 per week, compared with \$663 for nonunion workers.
- Median usual earnings of both union and nonunion workers have risen moderately since 1983. Adjusted for inflation, union members earned \$96 more per week in 2007 than in 1983, while nonunion workers saw an increase of \$94. These changes represent a 12.5-percent increase for union members and a 16.5-percent increase for nonunion workers between 1983 and 2007.
- The difference in earnings between the two groups was influenced by the distributions of union and nonunion workers by occupation, industry, firm size, and geographic region, as well as by coverage of a collective bargaining agreement.

### 10. Among full-time union and nonunion workers, women had lower weekly earnings than men in 2007

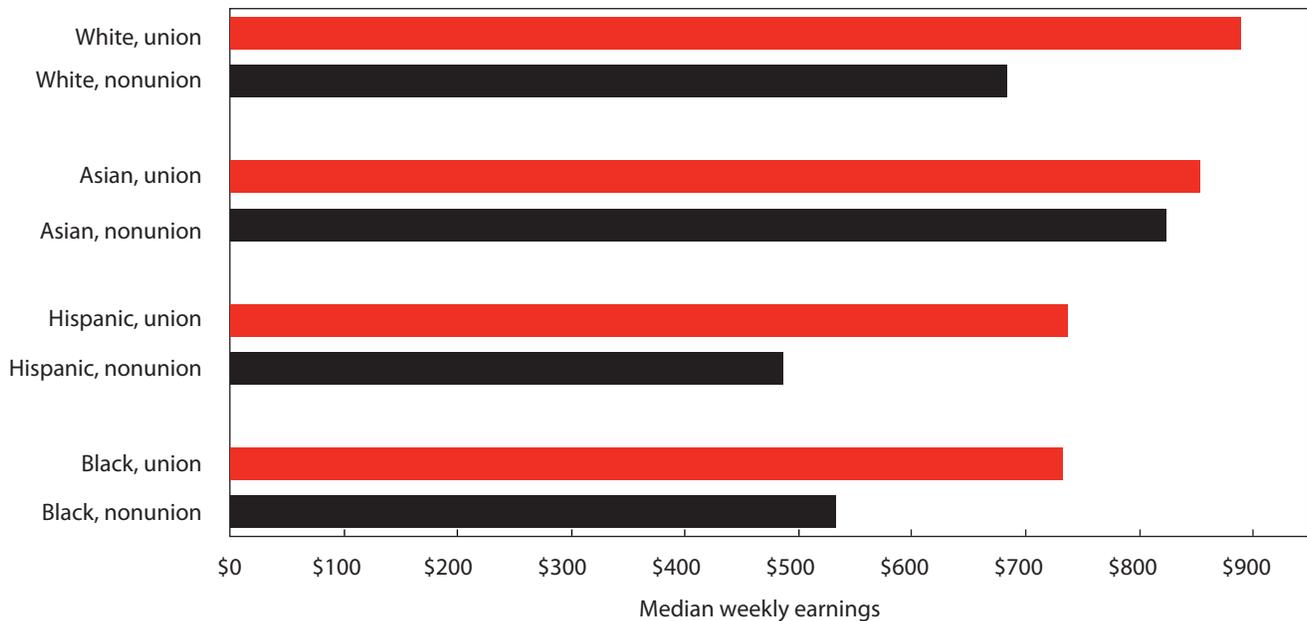

NOTE: The term “nonunion” refers to workers who are neither members of a union nor represented by a union on their job. Earnings are median usual weekly earnings of full-time wage and salary workers.

SOURCE: Current Population Survey (CPS), annual averages.

- In 2007, median usual weekly earnings of full-time workers were lower for women than for men, regardless of union membership status. In 2007, women union members earned \$790 per week, which was 87 percent of what union men earned (\$913). Among nonunion workers, women earned \$592, or 80 percent of what men were paid (\$738).
- The difference in earnings between men and women was smaller among union members (\$123) than among nonunion workers (\$146).
- Among both men and women, weekly earnings of full-time wage and salary workers were higher for union members than for nonunion workers. In 2007, union women earned 33 percent more than nonunion women, and union men earned 24 percent more than nonunion men.
- The difference in earnings between the groups shown in the chart was influenced by the distributions of union and nonunion workers by occupation, industry, firm size, and geographic region, as well as by coverage of a collective bargaining agreement.

**11. Among full-time employees of the same race or ethnicity, most union members earned more per week than their nonunion counterparts in 2007**

NOTE: The term “nonunion” refers to workers who are neither members of a union nor represented by a union on their job. Hispanics can be of any race. Earnings are median usual weekly earnings of full-time wage and salary workers.  
 SOURCE: Current Population Survey (CPS), annual averages.

- White, black, and Hispanic union members who worked full time had substantially higher median usual weekly earnings than their nonunion counterparts in 2007. Among Asians, there was little difference between the earnings of union and nonunion members.
- White and Asian union members had higher median usual weekly earnings than Blacks or Hispanics. Non-union Whites and Asians also had higher earnings than Blacks or Hispanics who were not union members.
- Among Hispanics who worked full time, union members earned \$249 more per week than nonunion workers. This was the largest difference between union and nonunion median usual weekly earnings for any race or ethnic group.
- The differences in earnings among the groups shown in the chart were influenced by the distributions of union and nonunion workers by occupation, industry, firm size, and geographic region, as well as by coverage of a collective bargaining agreement.

## Creative destruction and productivity

As economists like to say, “assume” there is a factory producing a certain amount of output using a given amount of inputs such as capital and labor. Suppose there is demand for more of this particular output. What can be done? Perhaps enlarge the factory and increase the inputs accordingly. Or build a second factory and supply it with the needed inputs. But what about increasing the output of the factory without using any more of a particular input, say, labor? Can that be done? The question that is asked of manufacturers can also be asked of retail stores: can they sell more products with the same amount of labor? In many cases, the answer is yes. When more output is obtained with an unchanged input of labor, labor productivity has increased. Growth in productivity can result in a rising standard of living.

In the United States, labor productivity—measured as a ratio of output per hour of labor—has, except for some slight downturns during recessions, increased steadily for decades. However, the Nation’s aggregate measure of labor productivity does not apply equally to individual firms. Just as the unemployment rate varies from location to location, and the unemployment rate for the Nation as a whole may not adequately describe areas with unemployment rates significantly different than the national rate, so the Nation’s aggregate growth in labor productivity does not describe every firm. Firms vary from one another: their managerial philosophy, use of technology, organizational structure, size, knowledge, location, and other

factors are different. Thus their ability to adapt new ideas and respond to changing market conditions also varies. Look at the aggregate measure of labor productivity for the Nation as a whole, and one misses something that economists such as Joseph Schumpeter held to be an essential part of capitalism: the “creative destruction” that is the birth and death of individual firms. The theory of creative destruction has intrigued economists for decades, but data which allow the theory to be tested have only become available in recent years.

In “Creative Destruction and Aggregate Productivity Growth” (*Business Review*, Third Quarter 2008, Federal Reserve Bank of Philadelphia) Shigeru Fujita makes the case for analyzing productivity at certain types of establishments, comparing their productivity measures to the Nation’s aggregate, and calculating how much each type of establishment contributes to overall growth in productivity. The types of establishments are defined as those that are extant throughout an entire period for which the aggregate productivity is known, those that changed in size during the period, and those that came into existence or ceased to exist during the period.

Among the findings is that entry of new establishments accounted for 30 percent of productivity growth in manufacturing over the 1977–87 period, whereas the largest share of productivity growth came from establishments that existed throughout the period. Furthermore, the data show that firms that did not survive from the beginning to the end of the period showed markedly lower productivity than those that did survive. This evidence is consistent with the theory

of creative destruction. Higher productivity, the result of innovation, in new and existing establishments spurs other establishments to improve their own production methods—or face the dismal consequences.

In retail trade the share of productivity growth due to new establishments is markedly higher: 98 percent. Retail trade is characterized by two things: the births of new establishments belonging to existing firms that are expanding into new locations, that is, new retail chain stores; and the death of establishments accompanying the death of the parent firm. Large chains with retail establishments throughout the Nation possess significantly higher levels of productivity than firms that operate a single retail establishment. One study cited by Fujita found that establishments operating nationally are about 24 percent more productive than single-unit firms.

This study affirms the importance of the process of creative destruction in shaping the aggregate measure of labor productivity and in the U.S. economy; those establishments, whether they are new or old, that creatively find ways to increase productivity will thrive, and eventually displace and destroy older and less productive establishments. □

## The European Union and its new members

*Industrial relations in Central and Eastern Europe/Transformation and integration/A comparison of the eight new EU member states.* Edited by Heribert Kohl and Hans-Wolfgang Platzer (translated by Pete Burgess). Brussels, Belgium, ETUI, 2004, 422 pp., 27 euros.

Heribert Kohl and Hans-Wolfgang Platzer offer a comparative evaluation of the history, developing structures, and emerging problems in the 2004 transition of eight Central and Eastern European countries (CEE-8) to the European Union (EU): Estonia, Latvia, Lithuania, Poland, Czech Republic, Slovak Republic, Hungary, and Slovenia. Their first-time study compares the standards and practice of employment law; industrial relations at the level of the workplace, company, industry, and region; state-level tripartism (defined here as social dialogue between the government, trade unions, and employers); and changes relative to EU accession. The study recommends external support for accession countries, cooperation between countries, improvement through social dialogue and sectoral collective bargaining (defined here as the regional and national levels) and an erosion of differences between national-level employment relations systems.

The editors propose three specific groupings of the countries for examination. The first group includes the Baltic States of Estonia, Latvia, and Lithuania. These former Soviet republics underwent a radical reorientation. Small and medium sized

enterprises were created (with waning Russian Federation integration) and industrial relations were decentralized. These countries had positive experiences with market-oriented industrial relations—with the continued practice of employment law established in the interregnum between the two world wars.

The second, or Visegrad, group includes Poland, Czech Republic, Slovak Republic, and Hungary. This group has had a long tradition of industrialization and trade links with Western Europe and only a recent history as formally independent socialist states within the Soviet Union's geographical arc.

Slovenia is considered separately due to its unique characteristics. Initially a socialist market economy with self-managed enterprises and a pluralistic state structure, the market had to be completely reoriented to the EU after independence from the former Yugoslavia. Slovenia's population is better educated relative to the other seven countries and its approach to the transition has been more structurally conservative (that is, they maintained existing structures) and innovative (that is, they have been willing to adapt EU employment law).

Government, union, and employer institutions emerged among the CEE-8 countries for the purpose of consulting and policy setting. Kohl and Platzer note, however, that none of these bodies have been capable of markedly shaping employment law in these eight countries.

Industrial relations is considered at the workplace, sector, regional, and national levels for the CEE-8 countries. Each of these countries experienced a loss of union protection and greater pressure from management at

the workplace level, resulting in low levels of collective bargaining and a lack of agreements. Most labor contracts are set by company agreement rather than works councils. Some successes were achieved due to the positive influences of joint ventures with multinational firms, but employer associations were rarely able to organize with initiatives for modern and cooperative forms of management. The study further cites the strength of works councils as a legally based form of employee representation. These councils are more numerous and more favorable to industrial relations in the southern group of countries (Slovenia, Hungary, and Slovakia) than in other parts of the CEE-8.

With the exception of Slovenia (and Slovak Republic, to an extent), collective bargaining is conducted mainly at the workplace or national level under tripartite agreements. Therefore, there is little data for comparing industry-level agreements for the CEE-8 countries. Trade unions are weak due to division within the trade union movement itself in most of the countries. The lack of employer associations contributes to limited collective bargaining above the workplace level. Another difference highlighted by Kohl and Platzer is that, for most Western European employer associations, industry agreements have allowed for wage cost stability whereas employers in the CEE-8 countries have not accepted that view. Also, pay setting in the CEE-8 is mainly at the company level, in contrast to industry bargaining in Western Europe. The findings of the study illustrate strike activity confined almost entirely to the public sector, with corresponding pay levels well above those of

the competitive private sector. This is further evidence of the slow long-term convergence of wages between the CEE-8 countries and EU member states.

The Kohl-Platzer study includes an East-West comparison of industrial relations as well. Although the models show that diversity in industrial relations continues within the EU, and challenges within those systems are dealt with according to national priorities, there is also standardization due to the influence of EU integration. Examples include the European Works Councils Directive of 1994 (creating the first institution of collective labor law at the European level) and the establishment of the EU employment policy. The controversial debate over the future of industrial relations and collective bargaining in EU member states is also considered by the editors. The changes in industrial relations mentioned include the loss of significance of collective bargaining parties, decentralization, and the focus of regulation shifting to the workplace.

The transformation of industrial relations in Western Europe is illustrated through examples of the “Thatcher Revolution” in the United Kingdom (weakening union organization and abolishing the closed shop), the 1982 Auroux laws in France (increased collective agreements at the workplace and multi-enterprise levels), and the transformation of bargaining in Italy from an adversarial to an institutionalized system. This transformation took place with regulations at the workplace, sector, and national levels (probably due to the European Monetary Union Convergence—the criteria which must be met by member states of the EU before they are permitted to adopt the euro as the single currency and monetary system).

Finally, the book considers industrial relations in the enlarged EU relative to the European Social Model. This model is “a vision of society” that combines sustainable economic growth with ever-improving living and working conditions. It implies full employment, good quality jobs, equal opportunities, social protection for all, social inclusion, and citizen involvement in the decisions that affect them.

In an enlarged EU, what are the prerequisites and challenges for successful EU integration? According to the editors, successful integration can be attained by external support and mutual cooperation between CEE-8 countries. Specifically, improved social dialogue and industrial relations are necessary for achieving it. The study indicates that successful integration is likely to result from the European Works Councils Directive. To promote social dialogue, they recommend instituting an official register of collective agreements and EU projects. Utilizing specialized training agencies for personnel, management, and negotiating workplace agreements will strengthen tripartism with well-established capabilities and expertise. Additionally, studies suggest that sectoral collective bargaining strengthens the development of productivity and reduces the frequency of migration to Western Europe. Successful integration is also related to achieving a balance of interests at work—through pay, benefits, quality assurance, and personnel management (within the scope of preserving, creating, and shaping jobs).

Industrial relations must be expanded from the “shop floor” to industry level. For example, Kohl and Platzer note that a low minimum wage in new member states hampers convergence. Compromise on agree-

ments to raise wages has failed, in some instances, due to governments of those countries (often a significant employer) failing to support a minimum wage increase.

One of the most serious consequences of transition in the CEE-8 countries has been in the area of unemployment. Due to unresolved structural problems in some countries there is no single cause or easy solution, especially for the younger generation. Effective long-term alleviation of unemployment will come from greater business activity (capital inflows, modernization, innovation, employee skills, and flexibility). New effective systems of social security—specifically, social support for unemployment—is often only possible at payment levels below relative national poverty levels. Many CEE-8 employees are forced to work second jobs or rely on overtime.

Kohl and Platzer have provided additional insight into the complex issue of European Union integration. Their study is most useful to readers with a background in labor relations and intricate knowledge about the history of the European Union. There is extensive use of jargon related to that topic, so additional research may be required. The book provides useful detailed information about each country that acceded to the EU in 2004 (too extensive to cover here entirely), will add to the evolving study of industrial relations, and be useful for the integration of additional countries to the European Union. The current financial crisis will certainly provide another critical impact on EU integration, as will the ratification of the Lisbon Treaty. □

# Notes on Current Labor Statistics

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics: series on labor force; employment; unemployment; labor compensation; consumer, producer, and international prices; productivity; international comparisons; and injury and illness statistics. In the notes that follow, the data in each group of tables are briefly described; key definitions are given; notes on the data are set forth; and sources of additional information are cited.

## General notes

The following notes apply to several tables in this section:

**Seasonal adjustment.** Certain monthly and quarterly data are adjusted to eliminate the effect on the data of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might prevent short-term evaluation of the statistical series. Tables containing data that have been adjusted are identified as “seasonally adjusted.” (All other data are not seasonally adjusted.) Seasonal effects are estimated on the basis of current and past experiences. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted data appear in tables 1–14, 17–21, 48, and 52. Seasonally adjusted labor force data in tables 1 and 4–9 and seasonally adjusted establishment survey data shown in tables 1, 12–14, and 17 are revised in the March 2007 *Review*. A brief explanation of the seasonal adjustment methodology appears in “Notes on the data.”

Revisions in the productivity data in table 54 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month-to-month and quarter-to-quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All-Items CPI. Only seasonally adjusted percent changes are available for this series.

**Adjustments for price changes.** Some data—such as the “real” earnings shown in table 14—are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current-dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of \$3 and a current price index number of 150, where 1982 = 100, the hourly rate expressed in 1982 dollars is \$2 ( $\$3/150 \times 100 = \$2$ ). The \$2 (or any other resulting

values) are described as “real,” “constant,” or “1982” dollars.

## Sources of information

Data that supplement the tables in this section are published by the Bureau in a variety of sources. Definitions of each series and notes on the data are contained in later sections of these Notes describing each set of data. For detailed descriptions of each data series, see *BLS Handbook of Methods*, Bulletin 2490. Users also may wish to consult *Major Programs of the Bureau of Labor Statistics*, Report 919. News releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule appearing on the back cover of this issue.

More information about labor force, employment, and unemployment data and the household and establishment surveys underlying the data are available in the Bureau’s monthly publication, *Employment and Earnings*. Historical unadjusted and seasonally adjusted data from the household survey are available on the Internet:

[www.bls.gov/cps/](http://www.bls.gov/cps/)

Historically comparable unadjusted and seasonally adjusted data from the establishment survey also are available on the Internet:

[www.bls.gov/ces/](http://www.bls.gov/ces/)

Additional information on labor force data for areas below the national level are provided in the BLS annual report, *Geographic Profile of Employment and Unemployment*.

For a comprehensive discussion of the Employment Cost Index, see *Employment Cost Indexes and Levels, 1975–95*, BLS Bulletin 2466. The most recent data from the Employee Benefits Survey appear in the following Bureau of Labor Statistics bulletins: *Employee Benefits in Medium and Large Firms*; *Employee Benefits in Small Private Establishments*; and *Employee Benefits in State and Local Governments*.

More detailed data on consumer and producer prices are published in the monthly periodicals, *The CPI Detailed Report* and *Producer Price Indexes*. For an overview of the 1998 revision of the CPI, see the December 1996 issue of the *Monthly Labor Review*. Additional data on international prices appear in monthly news releases.

Listings of industries for which productivity indexes are available may be found on the Internet:

[www.bls.gov/lpc/](http://www.bls.gov/lpc/)

For additional information on international comparisons data, see *Internation-*

*tional Comparisons of Unemployment*, Bulletin 1979.

Detailed data on the occupational injury and illness series are published in *Occupational Injuries and Illnesses in the United States, by Industry*, a BLS annual bulletin.

Finally, the *Monthly Labor Review* carries analytical articles on annual and longer term developments in labor force, employment, and unemployment; employee compensation and collective bargaining; prices; productivity; international comparisons; and injury and illness data.

## Symbols

n.e.c. = not elsewhere classified.

n.e.s. = not elsewhere specified.

p = preliminary. To increase the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.

r = revised. Generally, this revision reflects the availability of later data, but also may reflect other adjustments.

## Comparative Indicators

(Tables 1–3)

Comparative indicators tables provide an overview and comparison of major BLS statistical series. Consequently, although many of the included series are available monthly, all measures in these comparative tables are presented quarterly and annually.

**Labor market indicators** include employment measures from two major surveys and information on rates of change in compensation provided by the Employment Cost Index (ECI) program. The labor force participation rate, the employment-population ratio, and unemployment rates for major demographic groups based on the Current Population (“household”) Survey are presented, while measures of employment and average weekly hours by major industry sector are given using nonfarm payroll data. The Employment Cost Index (compensation), by major sector and by bargaining status, is chosen from a variety of BLS compensation and wage measures because it provides a comprehensive measure of employer costs for hiring labor, not just outlays for wages, and it is not affected by employment shifts among occupations and industries.

Data on **changes in compensation, prices, and productivity** are presented in table 2. Measures of rates of change of compensation

and wages from the Employment Cost Index program are provided for all civilian nonfarm workers (excluding Federal and household workers) and for all private nonfarm workers. Measures of changes in consumer prices for all urban consumers; producer prices by stage of processing; overall prices by stage of processing; and overall export and import price indexes are given. Measures of productivity (output per hour of all persons) are provided for major sectors.

**Alternative measures of wage and compensation rates of change**, which reflect the overall trend in labor costs, are summarized in table 3. Differences in concepts and scope, related to the specific purposes of the series, contribute to the variation in changes among the individual measures.

### Notes on the data

Definitions of each series and notes on the data are contained in later sections of these notes describing each set of data.

## Employment and Unemployment Data

(Tables 1; 4–29)

### Household survey data

#### Description of the series

Employment data in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

#### Definitions

**Employed persons** include (1) all those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

**Unemployed persons** are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding

4 weeks. Persons who did not look for work because they were on layoff are also counted among the unemployed. **The unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population. Persons **not in the labor force** are those not classified as employed or unemployed. This group includes discouraged workers, defined as persons who want and are available for a job and who have looked for work sometime in the past 12 months (or since the end of their last job if they held one within the past 12 months), but are not currently looking, because they believe there are no jobs available or there are none for which they would qualify. The **civilian noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy. The **civilian labor force participation rate** is the proportion of the civilian noninstitutional population that is in the labor force. The **employment-population ratio** is employment as a percent of the civilian noninstitutional population.

### Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the intercensal years. These adjustments affect the comparability of historical data. A description of these adjustments and their effect on the various data series appears in the Explanatory Notes of *Employment and Earnings*. For a discussion of changes introduced in January 2003, see "Revisions to the Current Population Survey Effective in January 2003" in the February 2003 issue of *Employment and Earnings* (available on the BLS Web site at [www.bls.gov/cps/rvcps03.pdf](http://www.bls.gov/cps/rvcps03.pdf)).

Effective in January 2003, BLS began using the X-12 ARIMA seasonal adjustment program to seasonally adjust national labor force data. This program replaced the X-11 ARIMA program which had been used since January 1980. See "Revision of Seasonally Adjusted Labor Force Series in 2003," in the February 2003 issue of *Employment and Earnings* (available on the BLS Web site at [www.bls.gov/cps/cpsrs.pdf](http://www.bls.gov/cps/cpsrs.pdf)) for a discussion of the introduction of the use of X-12 ARIMA for seasonal adjustment of the labor force data and the effects that it had on the data.

At the beginning of each calendar year, historical seasonally adjusted data usually are revised, and projected seasonal adjustment factors are calculated for use during the

January–June period. The historical seasonally adjusted data usually are revised for only the most recent 5 years. In July, new seasonal adjustment factors, which incorporate the experience through June, are produced for the July–December period, but no revisions are made in the historical data.

FOR ADDITIONAL INFORMATION on national household survey data, contact the Division of Labor Force Statistics: (202) 691-6378.

## Establishment survey data

### Description of the series

Employment, hours, and earnings data in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by about 160,000 businesses and government agencies, which represent approximately 400,000 individual worksites and represent all industries except agriculture. The active CES sample covers approximately one-third of all nonfarm payroll workers. Industries are classified in accordance with the 2002 North American Industry Classification System. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

### Definitions

An **establishment** is an economic unit which produces goods or services (such as a factory or store) at a single location and is engaged in one type of economic activity.

**Employed persons** are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th day of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

**Production workers** in the goods-producing industries cover employees, up through the level of working supervisors, who engage directly in the manufacture or construction of the establishment's product. In private service-providing industries, data are collected for nonsupervisory workers, which include most employees except those in executive,

managerial, and supervisory positions. Those workers mentioned in tables 11–16 include production workers in manufacturing and natural resources and mining; construction workers in construction; and nonsupervisory workers in all private service-providing industries. Production and nonsupervisory workers account for about four-fifths of the total employment on private nonagricultural payrolls.

**Earnings** are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

**Hours** represent the average weekly hours of production or nonsupervisory workers for which pay was received, and are different from standard or scheduled hours. **Overtime hours** represent the portion of average weekly hours which was in excess of regular hours and for which overtime premiums were paid.

The **Diffusion Index** represents the percent of industries in which employment was rising over the indicated period, plus one-half of the industries with unchanged employment; 50 percent indicates an equal balance between industries with increasing and decreasing employment. In line with Bureau practice, data for the 1-, 3-, and 6-month spans are seasonally adjusted, while those for the 12-month span are unadjusted. Table 17 provides an index on private nonfarm employment based on 278 industries, and a manufacturing index based on 84 industries. These indexes are useful for measuring the dispersion of economic gains or losses and are also economic indicators.

### Notes on the data

Establishment survey data are annually adjusted to comprehensive counts of employment (called “benchmarks”). The March 2003 benchmark was introduced in February 2004 with the release of data for January 2004, published in the March 2004 issue of the *Review*. With the release in June 2003, CES completed a conversion from the Standard Industrial Classification (SIC) system to the North American Industry Classification System (NAICS) and completed the transition from its original quota sample design to a probability-based sample design. The industry-coding update included reconstruction of historical estimates in order to preserve

time series for data users. Normally 5 years of seasonally adjusted data are revised with each benchmark revision. However, with this release, the entire new time series history for all CES data series were re-seasonally adjusted due to the NAICS conversion, which resulted in the revision of all CES time series.

Also in June 2003, the CES program introduced concurrent seasonal adjustment for the national establishment data. Under this methodology, the first preliminary estimates for the current reference month and the revised estimates for the 2 prior months will be updated with concurrent factors with each new release of data. Concurrent seasonal adjustment incorporates all available data, including first preliminary estimates for the most current month, in the adjustment process. For additional information on all of the changes introduced in June 2003, see the June 2003 issue of *Employment and Earnings* and “Recent changes in the national Current Employment Statistics survey,” *Monthly Labor Review*, June 2003, pp. 3–13.

Revisions in State data (table 11) occurred with the publication of January 2003 data. For information on the revisions for the State data, see the March and May 2003 issues of *Employment and Earnings*, and “Recent changes in the State and Metropolitan Area CES survey,” *Monthly Labor Review*, June 2003, pp. 14–19.

Beginning in June 1996, the BLS uses the X-12-ARIMA methodology to seasonally adjust establishment survey data. This procedure, developed by the Bureau of the Census, controls for the effect of varying survey intervals (also known as the 4- versus 5-week effect), thereby providing improved measurement of over-the-month changes and underlying economic trends. Revisions of data, usually for the most recent 5-year period, are made once a year coincident with the benchmark revisions.

In the establishment survey, estimates for the most recent 2 months are based on incomplete returns and are published as preliminary in the tables (12–17 in the *Review*). When all returns have been received, the estimates are revised and published as “final” (prior to any benchmark revisions) in the third month of their appearance. Thus, December data are published as preliminary in January and February and as final in March. For the same reasons, quarterly establishment data (table 1) are preliminary for the first 2 months of publication and final in the third month. Fourth-quarter data are published as preliminary in January and February and as final in March.

FOR ADDITIONAL INFORMATION on

establishment survey data, contact the Division of Current Employment Statistics: (202) 691-6555.

## Unemployment data by State

### Description of the series

Data presented in this section are obtained from the Local Area Unemployment Statistics (LAUS) program, which is conducted in cooperation with State employment security agencies.

Monthly estimates of the labor force, employment, and unemployment for States and sub-State areas are a key indicator of local economic conditions, and form the basis for determining the eligibility of an area for benefits under Federal economic assistance programs such as the Job Training Partnership Act. Seasonally adjusted unemployment rates are presented in table 10. Insofar as possible, the concepts and definitions underlying these data are those used in the national estimates obtained from the CPS.

### Notes on the data

Data refer to State of residence. Monthly data for all States and the District of Columbia are derived using standardized procedures established by BLS. Once a year, estimates are revised to new population controls, usually with publication of January estimates, and benchmarked to annual average CPS levels.

FOR ADDITIONAL INFORMATION on data in this series, call (202) 691-6392 (table 10) or (202) 691-6559 (table 11).

## Quarterly Census of Employment and Wages

### Description of the series

Employment, wage, and establishment data in this section are derived from the quarterly tax reports submitted to State employment security agencies by private and State and local government employers subject to State unemployment insurance (UI) laws and from Federal, agencies subject to the Unemployment Compensation for Federal Employees (UCFE) program. Each quarter, State agencies edit and process the data and send the information to the Bureau of Labor Statistics.

The Quarterly Census of Employment and Wages (QCEW) data, also referred as ES-202 data, are the most complete enumeration of employment and wage information by industry at the national, State, metropolitan area, and county levels. They have broad economic significance in evaluating labor

market trends and major industry developments.

## Definitions

In general, the Quarterly Census of Employment and Wages monthly employment data represent the number of **covered workers** who worked during, or received pay for, the pay period that included the 12th day of the month. **Covered private industry employment** includes most corporate officials, executives, supervisory personnel, professionals, clerical workers, wage earners, piece workers, and part-time workers. It excludes proprietors, the unincorporated self-employed, unpaid family members, and certain farm and domestic workers. Certain types of nonprofit employers, such as religious organizations, are given a choice of coverage or exclusion in a number of States. Workers in these organizations are, therefore, reported to a limited degree.

Persons on paid sick leave, paid holiday, paid vacation, and the like, are included. Persons on the payroll of more than one firm during the period are counted by each UI-subject employer if they meet the employment definition noted earlier. The employment count excludes workers who earned no wages during the entire applicable pay period because of work stoppages, temporary layoffs, illness, or unpaid vacations.

**Federal employment data** are based on reports of monthly employment and quarterly wages submitted each quarter to State agencies for all Federal installations with employees covered by the Unemployment Compensation for Federal Employees (UCFE) program, except for certain national security agencies, which are omitted for security reasons. Employment for all Federal agencies for any given month is based on the number of persons who worked during or received pay for the pay period that included the 12th of the month.

An **establishment** is an economic unit, such as a farm, mine, factory, or store, that produces goods or provides services. It is typically at a single physical location and engaged in one, or predominantly one, type of economic activity for which a single industrial classification may be applied. Occasionally, a single physical location encompasses two or more distinct and significant activities. Each activity should be reported as a separate establishment if separate records are kept and the various activities are classified under different NAICS industries.

Most employers have only one establishment; thus, the establishment is the predominant reporting unit or statistical

entity for reporting employment and wages data. Most employers, including State and local governments who operate more than one establishment in a State, file a Multiple Worksite Report each quarter, in addition to their quarterly UI report. The Multiple Worksite Report is used to collect separate employment and wage data for each of the employer's establishments, which are not detailed on the UI report. Some very small multi-establishment employers do not file a Multiple Worksite Report. When the total employment in an employer's secondary establishments (all establishments other than the largest) is 10 or fewer, the employer generally will file a consolidated report for all establishments. Also, some employers either cannot or will not report at the establishment level and thus aggregate establishments into one consolidated unit, or possibly several units, though not at the establishment level.

For the Federal Government, the reporting unit is the **installation**: a single location at which a department, agency, or other government body has civilian employees. Federal agencies follow slightly different criteria than do private employers when breaking down their reports by installation. They are permitted to combine as a single statewide unit: 1) all installations with 10 or fewer workers, and 2) all installations that have a combined total in the State of fewer than 50 workers. Also, when there are fewer than 25 workers in all secondary installations in a State, the secondary installations may be combined and reported with the major installation. Last, if a Federal agency has fewer than five employees in a State, the agency headquarters office (regional office, district office) serving each State may consolidate the employment and wages data for that State with the data reported to the State in which the headquarters is located. As a result of these reporting rules, the number of reporting units is always larger than the number of employers (or government agencies) but smaller than the number of actual establishments (or installations).

Data reported for the first quarter are tabulated into **size** categories ranging from worksites of very small size to those with 1,000 employees or more. The size category is determined by the establishment's March employment level. It is important to note that each establishment of a multi-establishment firm is tabulated separately into the appropriate size category. The total employment level of the reporting multi-establishment firm is not used in the size tabulation.

Covered employers in most States report total **wages** paid during the calendar quarter, regardless of when the services were performed. A few State laws, however, specify that wages be reported for, or based on the

period during which services are performed rather than the period during which compensation is paid. Under most State laws or regulations, wages include bonuses, stock options, the cash value of meals and lodging, tips and other gratuities, and, in some States, employer contributions to certain deferred compensation plans such as 401(k) plans.

Covered employer contributions for old-age, survivors, and disability insurance (OASDI), health insurance, unemployment insurance, workers' compensation, and private pension and welfare funds are not reported as wages. Employee contributions for the same purposes, however, as well as money withheld for income taxes, union dues, and so forth, are reported even though they are deducted from the worker's gross pay.

**Wages of covered Federal workers** represent the gross amount of all payrolls for all pay periods ending within the quarter. This includes cash allowances, the cash equivalent of any type of remuneration, severance pay, withholding taxes, and retirement deductions. Federal employee remuneration generally covers the same types of services as for workers in private industry.

**Average annual wage** per employee for any given industry are computed by dividing total annual wages by annual average employment. A further division by 52 yields average weekly wages per employee. Annual pay data only approximate annual earnings because an individual may not be employed by the same employer all year or may work for more than one employer at a time.

Average weekly or annual wage is affected by the ratio of full-time to part-time workers as well as the number of individuals in high-paying and low-paying occupations. When average pay levels between States and industries are compared, these factors should be taken into consideration. For example, industries characterized by high proportions of part-time workers will show average wage levels appreciably less than the weekly pay levels of regular full-time employees in these industries. The opposite effect characterizes industries with low proportions of part-time workers, or industries that typically schedule heavy weekend and overtime work. Average wage data also may be influenced by work stoppages, labor turnover rates, retroactive payments, seasonal factors, bonus payments, and so on.

## Notes on the data

Beginning with the release of data for 2001, publications presenting data from the Covered Employment and Wages program have switched to the 2002 version of the North

American Industry Classification System (NAICS) as the basis for the assignment and tabulation of economic data by industry. NAICS is the product of a cooperative effort on the part of the statistical agencies of the United States, Canada, and Mexico. Due to difference in NAICS and Standard Industrial Classification (SIC) structures, industry data for 2001 is not comparable to the SIC-based data for earlier years.

Effective January 2001, the program began assigning Indian Tribal Councils and related establishments to local government ownership. This BLS action was in response to a change in Federal law dealing with the way Indian Tribes are treated under the Federal Unemployment Tax Act. This law requires federally recognized Indian Tribes to be treated similarly to State and local governments. In the past, the Covered Employment and Wage (CEW) program coded Indian Tribal Councils and related establishments in the private sector. As a result of the new law, CEW data reflects significant shifts in employment and wages between the private sector and local government from 2000 to 2001. Data also reflect industry changes. Those accounts previously assigned to civic and social organizations were assigned to tribal governments. There were no required industry changes for related establishments owned by these Tribal Councils. These tribal business establishments continued to be coded according to the economic activity of that entity.

To insure the highest possible quality of data, State employment security agencies verify with employers and update, if necessary, the industry, location, and ownership classification of all establishments on a 3-year cycle. Changes in establishment classification codes resulting from the verification process are introduced with the data reported for the first quarter of the year. Changes resulting from improved employer reporting also are introduced in the first quarter. For these reasons, some data, especially at more detailed geographic levels, may not be strictly comparable with earlier years.

County definitions are assigned according to Federal Information Processing Standards Publications as issued by the National Institute of Standards and Technology. Areas shown as counties include those designated as independent cities in some jurisdictions and, in Alaska, those areas designated by the Census Bureau where counties have not been created. County data also are presented for the New England States for comparative purposes, even though townships are the more common designation used in New England (and New Jersey).

The Office of Management and Budget

(OMB) defines metropolitan areas for use in Federal statistical activities and updates these definitions as needed. Data in this table use metropolitan area criteria established by OMB in definitions issued June 30, 1999 (OMB Bulletin No. 99-04). These definitions reflect information obtained from the 1990 Decennial Census and the 1998 U.S. Census Bureau population estimate. A complete list of metropolitan area definitions is available from the National Technical Information Service (NTIS), Document Sales, 5205 Port Royal Road, Springfield, Va. 22161, telephone 1-800-553-6847.

OMB defines metropolitan areas in terms of entire counties, except in the six New England States where they are defined in terms of cities and towns. New England data in this table, however, are based on a county concept defined by OMB as New England County Metropolitan Areas (NECMA) because county-level data are the most detailed available from the Quarterly Census of Employment and Wages. The NECMA is a county-based alternative to the city- and town-based metropolitan areas in New England. The NECMA for a Metropolitan Statistical Area (MSA) include: (1) the county containing the first-named city in that MSA title (this county may include the first-named cities of other MSA, and (2) each additional county having at least half its population in the MSA in which first-named cities are in the county identified in step 1. The NECMA is officially defined areas that are meant to be used by statistical programs that cannot use the regular metropolitan area definitions in New England.

FOR ADDITIONAL INFORMATION on the covered employment and wage data, contact the Division of Administrative Statistics and Labor Turnover at (202) 691-6567.

## Job Openings and Labor Turnover Survey

### Description of the series

Data for the **Job Openings and Labor Turnover Survey** (JOLTS) are collected and compiled from a sample of 16,000 business establishments. Each month, data are collected for total employment, job openings, hires, quits, layoffs and discharges, and other separations. The JOLTS program covers all private nonfarm establishments such as factories, offices, and stores, as well as Federal, State, and local government entities in the 50 States and the District of Columbia. The JOLTS sample design is a random sample drawn from a universe of more than eight million establishments compiled as part of the

operations of the Quarterly Census of Employment and Wages, or QCEW, program. This program includes all employers subject to State unemployment insurance (UI) laws and Federal agencies subject to Unemployment Compensation for Federal Employees (UCFE).

The sampling frame is stratified by ownership, region, industry sector, and size class. Large firms fall into the sample with virtual certainty. JOLTS total employment estimates are controlled to the employment estimates of the Current Employment Statistics (CES) survey. A ratio of CES to JOLTS employment is used to adjust the levels for all other JOLTS data elements. Rates then are computed from the adjusted levels.

The monthly JOLTS data series begin with December 2000. Not seasonally adjusted data on job openings, hires, total separations, quits, layoffs and discharges, and other separations levels and rates are available for the total nonfarm sector, 16 private industry divisions and 2 government divisions based on the North American Industry Classification System (NAICS), and four geographic regions. Seasonally adjusted data on job openings, hires, total separations, and quits levels and rates are available for the total nonfarm sector, selected industry sectors, and four geographic regions.

### Definitions

Establishments submit **job openings** information for the last business day of the reference month. A job opening requires that (1) a specific position exists and there is work available for that position; and (2) work could start within 30 days regardless of whether a suitable candidate is found; and (3) the employer is actively recruiting from outside the establishment to fill the position. Included are full-time, part-time, permanent, short-term, and seasonal openings. Active recruiting means that the establishment is taking steps to fill a position by advertising in newspapers or on the Internet, posting help-wanted signs, accepting applications, or using other similar methods.

Jobs to be filled only by internal transfers, promotions, demotions, or recall from layoffs are excluded. Also excluded are jobs with start dates more than 30 days in the future, jobs for which employees have been hired but have not yet reported for work, and jobs to be filled by employees of temporary help agencies, employee leasing companies, outside contractors, or consultants. The job openings rate is computed by dividing the number of job openings by the sum of employment and job openings, and multiplying that quotient by 100.

**Hires** are the total number of additions to the payroll occurring at any time during the reference month, including both new and rehired employees and full-time and part-time, permanent, short-term and seasonal employees, employees recalled to the location after a layoff lasting more than 7 days, on-call or intermittent employees who returned to work after having been formally separated, and transfers from other locations. The hires count does not include transfers or promotions within the reporting site, employees returning from strike, employees of temporary help agencies or employee leasing companies, outside contractors, or consultants. The hires rate is computed by dividing the number of hires by employment, and multiplying that quotient by 100.

**Separations** are the total number of terminations of employment occurring at any time during the reference month, and are reported by type of separation—quits, layoffs and discharges, and other separations. Quits are voluntary separations by employees (except for retirements, which are reported as other separations). Layoffs and discharges are involuntary separations initiated by the employer and include layoffs with no intent to rehire, formal layoffs lasting or expected to last more than 7 days, discharges resulting from mergers, downsizing, or closings, firings or other discharges for cause, terminations of permanent or short-term employees, and terminations of seasonal employees. Other separations include retirements, transfers to other locations, deaths, and separations due to disability. Separations do not include transfers within the same location or employees on strike.

The separations rate is computed by dividing the number of separations by employment, and multiplying that quotient by 100. The quits, layoffs and discharges, and other separations rates are computed similarly, dividing the number by employment and multiplying by 100.

## Notes on the data

The JOLTS data series on job openings, hires, and separations are relatively new. The full sample is divided into panels, with one panel enrolled each month. A full complement of panels for the original data series based on the 1987 Standard Industrial Classification (SIC) system was not completely enrolled in the survey until January 2002. The supplemental panels of establishments needed to create NAICS estimates were not completely enrolled until May 2003. The data collected up until

those points are from less than a full sample. Therefore, estimates from earlier months should be used with caution, as fewer sampled units were reporting data at that time.

In March 2002, BLS procedures for collecting hires and separations data were revised to address possible underreporting. As a result, JOLTS hires and separations estimates for months prior to March 2002 may not be comparable with estimates for March 2002 and later.

The Federal Government reorganization that involved transferring approximately 180,000 employees to the new Department of Homeland Security is not reflected in the JOLTS hires and separations estimates for the Federal Government. The Office of Personnel Management's record shows these transfers were completed in March 2003. The inclusion of transfers in the JOLTS definitions of hires and separations is intended to cover ongoing movements of workers between establishments. The Department of Homeland Security reorganization was a massive one-time event, and the inclusion of these intergovernmental transfers would distort the Federal Government time series.

Data users should note that seasonal adjustment of the JOLTS series is conducted with fewer data observations than is customary. The historical data, therefore, may be subject to larger than normal revisions. Because the seasonal patterns in economic data series typically emerge over time, the standard use of moving averages as seasonal filters to capture these effects requires longer series than are currently available. As a result, the stable seasonal filter option is used in the seasonal adjustment of the JOLTS data. When calculating seasonal factors, this filter takes an average for each calendar month after detrending the series. The stable seasonal filter assumes that the seasonal factors are fixed; a necessary assumption until sufficient data are available. When the stable seasonal filter is no longer needed, other program features also may be introduced, such as outlier adjustment and extended diagnostic testing. Additionally, it is expected that more series, such as layoffs and discharges and additional industries, may be seasonally adjusted when more data are available.

JOLTS hires and separations estimates cannot be used to exactly explain net changes in payroll employment. Some reasons why it is problematic to compare changes in payroll employment with JOLTS hires and separations, especially on a monthly basis, are: (1) the reference period for payroll employment is the pay period including the 12th of the month, while the reference period for hires and separations is the calendar month; and

(2) payroll employment can vary from month to month simply because part-time and on-call workers may not always work during the pay period that includes the 12th of the month. Additionally, research has found that some reporters systematically underreport separations relative to hires due to a number of factors, including the nature of their payroll systems and practices. The shortfall appears to be about 2 percent or less over a 12-month period.

FOR ADDITIONAL INFORMATION on the Job Openings and Labor Turnover Survey, contact the Division of Administrative Statistics and Labor Turnover at (202) 961-5870.

## Compensation and Wage Data

(Tables 1-3; 30-37)

The National Compensation Survey (NCS) produces a variety of compensation data. These include: The Employment Cost Index (ECI) and NCS benefit measures of the incidence and provisions of selected employee benefit plans. Selected samples of these measures appear in the following tables. NCS also compiles data on occupational wages and the Employer Costs for Employee Compensation (ECEC).

## Employment Cost Index

### Description of the series

The **Employment Cost Index** (ECI) is a quarterly measure of the rate of change in compensation per hour worked and includes wages, salaries, and employer costs of employee benefits. It is a Laspeyres Index that uses fixed employment weights to measure change in labor costs free from the influence of employment shifts among occupations and industries.

The ECI provides data for the civilian economy, which includes the total private nonfarm economy excluding private households, and the public sector excluding the Federal government. Data are collected each quarter for the pay period including the 12th day of March, June, September, and December.

Sample establishments are classified by industry categories based on the 2002 North American Classification System (NAICS). Within a sample establishment, specific job categories are selected and classified into about 800 occupations according to the 2000 Standard Occupational Classification (SOC) System. Individual occupations are com-

bined to represent one of ten intermediate aggregations, such as professional and related occupations, or one of five higher level aggregations, such as management, professional, and related occupations.

Fixed employment weights are used each quarter to calculate the most aggregate series—civilian, private, and State and local government. These fixed weights are also used to derive all of the industry and occupational series indexes. Beginning with the March 2006 estimates, 2002 fixed employment weights from the Bureau's Occupational Employment Statistics survey were introduced. From March 1995 to December 2005, 1990 employment counts were used. These fixed weights ensure that changes in these indexes reflect only changes in compensation, not employment shifts among industries or occupations with different levels of wages and compensation. For the series based on bargaining status, census region and division, and metropolitan area status, fixed employment data are not available. The employment weights are reallocated within these series each quarter based on the current ECI sample. The indexes for these series, consequently, are not strictly comparable with those for aggregate, occupational, and industry series.

## Definitions

**Total compensation** costs include wages, salaries, and the employer's costs for employee benefits.

**Wages and salaries** consist of earnings before payroll deductions, including production bonuses, incentive earnings, commissions, and cost-of-living adjustments.

**Benefits** include the cost to employers for paid leave, supplemental pay (including nonproduction bonuses), insurance, retirement and savings plans, and legally required benefits (such as Social Security, workers' compensation, and unemployment insurance).

Excluded from wages and salaries and employee benefits are such items as payment-in-kind, free room and board, and tips.

## Notes on the data

The ECI data in these tables reflect the con-version to the 2002 North American Industry Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. ECI series based on NAICS and SOC became the official BLS estimates starting in March 2006.

The ECI for changes in wages and salaries

in the private nonfarm economy was published beginning in 1975. Changes in total compensation cost—wages and salaries and benefits combined—were published beginning in 1980. The series of changes in wages and salaries and for total compensation in the State and local government sector and in the civilian nonfarm economy (excluding Federal employees) were published beginning in 1981. Historical indexes (December 2005=100) are available on the Internet: [www.bls.gov/ect/](http://www.bls.gov/ect/)

ADDITIONAL INFORMATION on the Employment Cost Index is available at [www.bls.gov/ncs/ect/home.htm](http://www.bls.gov/ncs/ect/home.htm) or by telephone at (202) 691-6199.

## National Compensation Survey Benefit Measures

### Description of the series

NCS benefit measures of employee benefits are published in two separate reports. The annual summary provides data on the incidence of (access to and participation in) selected benefits and provisions of paid holidays and vacations, life insurance plans, and other selected benefit programs. Data on percentages of establishments offering major employee benefits, and on the employer and employee shares of contributions to medical care premiums also are presented. Selected benefit data appear in the following tables. A second publication, published later, contains more detailed information about health and retirement plans.

### Definitions

**Employer-provided benefits** are benefits that are financed either wholly or partly by the employer. They may be sponsored by a union or other third party, as long as there is some employer financing. However, some benefits that are fully paid for by the employee also are included. For example, long-term care insurance paid entirely by the employee are included because the guarantee of insurability and availability at group premium rates are considered a benefit.

Employees are considered as having **access** to a benefit plan if it is available for their use. For example, if an employee is permitted to participate in a medical care plan offered by the employer, but the employee declines to do so, he or she is placed in the category with those having access to medical care.

Employees in contributory plans are considered as **participating** in an insurance or retirement plan if they have paid required

contributions and fulfilled any applicable service requirement. Employees in noncontributory plans are counted as participating regardless of whether they have fulfilled the service requirements.

**Defined benefit pension plans** use predetermined formulas to calculate a retirement benefit (if any), and obligate the employer to provide those benefits. Benefits are generally based on salary, years of service, or both.

**Defined contribution plans** generally specify the level of employer and employee contributions to a plan, but not the formula for determining eventual benefits. Instead, individual accounts are set up for participants, and benefits are based on amounts credited to these accounts.

**Tax-deferred savings plans** are a type of defined contribution plan that allow participants to contribute a portion of their salary to an employer-sponsored plan and defer income taxes until withdrawal.

**Flexible benefit plans** allow employees to choose among several benefits, such as life insurance, medical care, and vacation days, and among several levels of coverage within a given benefit.

## Notes on the data

ADDITIONAL INFORMATION ON THE NCS benefit measures is available at [www.bls.gov/ncs/ebs/home.htm](http://www.bls.gov/ncs/ebs/home.htm) or by telephone at (202) 691-6199.

## Work stoppages

### Description of the series

Data on work stoppages measure the number and duration of major strikes or lockouts (involving 1,000 workers or more) occurring during the month (or year), the number of workers involved, and the amount of work time lost because of stoppage. These data are presented in table 37.

Data are largely from a variety of published sources and cover only establishments directly involved in a stoppage. They do not measure the indirect or secondary effect of stoppages on other establishments whose employees are idle owing to material shortages or lack of service.

### Definitions

**Number of stoppages:** The number of strikes and lockouts involving 1,000 workers or more and lasting a full shift or longer.

**Workers involved:** The number of workers directly involved in the stoppage.

**Number of days idle:** The aggregate

number of workdays lost by workers involved in the stoppages.

**Days of idleness as a percent of estimated working time:** Aggregate workdays lost as a percent of the aggregate number of standard workdays in the period multiplied by total employment in the period.

## Notes on the data

This series is not comparable with the one terminated in 1981 that covered strikes involving six workers or more.

ADDITIONAL INFORMATION on work stoppages data is available at [www.bls.gov/cba/home.htm](http://www.bls.gov/cba/home.htm) or by telephone at (202) 691-6199.

## Price Data

(Tables 2; 38-46)

Price data are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period—December 2003 = 100 for many Producer Price Indexes (unless otherwise noted), 1982-84 = 100 for many Consumer Price Indexes (unless otherwise noted), and 1990 = 100 for International Price Indexes.

## Consumer Price Indexes

### Description of the series

The **Consumer Price Index** (CPI) is a measure of the average change in the prices paid by urban consumers for a fixed market basket of goods and services. The CPI is calculated monthly for two population groups, one consisting only of urban households whose primary source of income is derived from the employment of wage earners and clerical workers, and the other consisting of all urban households. The wage earner index (CPI-W) is a continuation of the historic index that was introduced well over a half-century ago for use in wage negotiations. As new uses were developed for the CPI in recent years, the need for a broader and more representative index became apparent. The all-urban consumer index (CPI-U), introduced in 1978, is representative of the 1993-95 buying habits of about 87 percent of the noninstitutional population of the United States at that time, compared with 32 percent represented in the CPI-W. In addition to wage earners and clerical workers, the CPI-U covers professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and

others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors' and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items are kept essentially unchanged between major revisions so that only price changes will be measured. All taxes directly associated with the purchase and use of items are included in the index.

Data collected from more than 23,000 retail establishments and 5,800 housing units in 87 urban areas across the country are used to develop the "U.S. city average." Separate estimates for 14 major urban centers are presented in table 39. The areas listed are as indicated in footnote 1 to the table. The area indexes measure only the average change in prices for each area since the base period, and do not indicate differences in the level of prices among cities.

### Notes on the data

In January 1983, the Bureau changed the way in which homeownership costs are measured for the CPI-U. A rental equivalence method replaced the asset-price approach to homeownership costs for that series. In January 1985, the same change was made in the CPI-W. The central purpose of the change was to separate shelter costs from the investment component of homeownership so that the index would reflect only the cost of shelter services provided by owner-occupied homes. An updated CPI-U and CPI-W were introduced with release of the January 1987 and January 1998 data.

FOR ADDITIONAL INFORMATION, contact the Division of Prices and Price Indexes: (202) 691-7000.

## Producer Price Indexes

### Description of the series

**Producer Price Indexes** (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. The sample used for calculating these indexes currently contains about 3,200 commodities and about 80,000 quotations per month, selected to represent the movement of prices of all commodities produced in the manufacturing; agriculture, forestry, and fishing; mining; and gas and electricity and public utilities sectors. The stage-of-processing structure of PPI organizes products by class of buyer and degree of fabrication (that is, finished goods, intermediate goods, and crude materials). The traditional commodity structure of PPI organizes products by similarity of end use or material composition. The industry and product structure of PPI organizes data in

accordance with the 2002 North American Industry Classification System and product codes developed by the U.S. Census Bureau.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

Since January 1992, price changes for the various commodities have been averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1987. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability-of-product groupings, and a number of special composite groups. All Producer Price Index data are subject to revision 4 months after original publication.

FOR ADDITIONAL INFORMATION, contact the Division of Industrial Prices and Price Indexes: (202) 691-7705.

## International Price Indexes

### Description of the series

The **International Price Program** produces monthly and quarterly export and import price indexes for nonmilitary goods and services traded between the United States and the rest of the world. The export price index provides a measure of price change for all products sold by U.S. residents to foreign buyers. ("Residents" is defined as in the national income accounts; it includes corporations, businesses, and individuals, but does not require the organizations to be U.S. owned nor the individuals to have U.S. citizenship.) The import price index provides a measure of price change for goods purchased from other countries by U.S. residents.

The product universe for both the import and export indexes includes raw materials, agricultural products, semifinished manufactures, and finished manufactures, including both capital and consumer goods. Price data for these items are collected primarily by mail questionnaire. In nearly all cases, the data are collected directly from the exporter or importer, although in a few cases, prices are obtained from other sources.

To the extent possible, the data gathered refer to prices at the U.S. border for exports and at either the foreign border or the U.S.

border for imports. For nearly all products, the prices refer to transactions completed during the first week of the month. Survey respondents are asked to indicate all discounts, allowances, and rebates applicable to the reported prices, so that the price used in the calculation of the indexes is the actual price for which the product was bought or sold.

In addition to general indexes of prices for U.S. exports and imports, indexes are also published for detailed product categories of exports and imports. These categories are defined according to the five-digit level of detail for the Bureau of Economic Analysis End-use Classification, the three-digit level for the Standard International Trade Classification (SITC), and the four-digit level of detail for the Harmonized System. Aggregate import indexes by country or region of origin are also available.

BLS publishes indexes for selected categories of internationally traded services, calculated on an international basis and on a balance-of-payments basis.

### Notes on the data

The export and import price indexes are weighted indexes of the Laspeyres type. The trade weights currently used to compute both indexes relate to 2000.

Because a price index depends on the same items being priced from period to period, it is necessary to recognize when a product's specifications or terms of transaction have been modified. For this reason, the Bureau's questionnaire requests detailed descriptions of the physical and functional characteristics of the products being priced, as well as information on the number of units bought or sold, discounts, credit terms, packaging, class of buyer or seller, and so forth. When there are changes in either the specifications or terms of transaction of a product, the dollar value of each change is deleted from the total price change to obtain the "pure" change. Once this value is determined, a linking procedure is employed which allows for the continued repricing of the item.

FOR ADDITIONAL INFORMATION, contact the Division of International Prices: (202) 691-7155.

## Productivity Data

(Tables 2; 47-50)

### Business and major sectors

#### Description of the series

The productivity measures relate real output to real input. As such, they encompass a fam-

ily of measures which include single-factor input measures, such as output per hour, output per unit of labor input, or output per unit of capital input, as well as measures of multifactor productivity (output per unit of combined labor and capital inputs). The Bureau indexes show the change in output relative to changes in the various inputs. The measures cover the business, nonfarm business, manufacturing, and nonfinancial corporate sectors.

Corresponding indexes of hourly compensation, unit labor costs, unit nonlabor payments, and prices are also provided.

### Definitions

**Output per hour of all persons** (labor productivity) is the quantity of goods and services produced per hour of labor input.

**Output per unit of capital services** (capital productivity) is the quantity of goods and services produced per unit of capital services input. **Multifactor productivity** is the quantity of goods and services produced per combined inputs. For private business and private nonfarm business, inputs include labor and capital units. For manufacturing, inputs include labor, capital, energy, nonenergy materials, and purchased business services.

**Compensation per hour** is total compensation divided by hours at work. Total compensation equals the wages and salaries of employees plus employers' contributions for social insurance and private benefit plans, plus an estimate of these payments for the self-employed (except for nonfinancial corporations in which there are no self-employed). **Real compensation per hour** is compensation per hour deflated by the change in the Consumer Price Index for All Urban Consumers.

**Unit labor costs** are the labor compensation costs expended in the production of a unit of output and are derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from current-dollar value of output and dividing by output.

**Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits.

**Unit profits** include corporate profits with inventory valuation and capital consumption adjustments per unit of output.

**Hours of all persons** are the total hours at work of payroll workers, self-employed persons, and unpaid family workers.

**Labor inputs** are hours of all persons adjusted for the effects of changes in the

education and experience of the labor force.

**Capital services** are the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets—equipment, structures, land, and inventories—weighted by rental prices for each type of asset.

**Combined units of labor and capital inputs** are derived by combining changes in labor and capital input with weights which represent each component's share of total cost. Combined units of labor, capital, energy, materials, and purchased business services are similarly derived by combining changes in each input with weights that represent each input's share of total costs. The indexes for each input and for combined units are based on changing weights which are averages of the shares in the current and preceding year (the Tornquist index-number formula).

### Notes on the data

Business sector output is an annually-weighted index constructed by excluding from real gross domestic product (GDP) the following outputs: general government, nonprofit institutions, paid employees of private households, and the rental value of owner-occupied dwellings. Nonfarm business also excludes farming. Private business and private nonfarm business further exclude government enterprises. The measures are supplied by the U.S. Department of Commerce's Bureau of Economic Analysis. Annual estimates of manufacturing sectoral output are produced by the Bureau of Labor Statistics. Quarterly manufacturing output indexes from the Federal Reserve Board are adjusted to these annual output measures by the BLS. Compensation data are developed from data of the Bureau of Economic Analysis and the Bureau of Labor Statistics. Hours data are developed from data of the Bureau of Labor Statistics.

The productivity and associated cost measures in tables 47-50 describe the relationship between output in real terms and the labor and capital inputs involved in its production. They show the changes from period to period in the amount of goods and services produced per unit of input.

Although these measures relate output to hours and capital services, they do not measure the contributions of labor, capital, or any other specific factor of production. Rather, they reflect the joint effect of many influences, including changes in technology; shifts in the composition of the labor force; capital investment; level of output; changes in the utilization of capacity, energy, material, and research and development; the organi-

zation of production; managerial skill; and characteristics and efforts of the work force.

FOR ADDITIONAL INFORMATION on this productivity series, contact the Division of Productivity Research: (202) 691-5606.

## Industry productivity measures

### Description of the series

The BLS industry productivity indexes measure the relationship between output and inputs for selected industries and industry groups, and thus reflect trends in industry efficiency over time. Industry measures include labor productivity, multifactor productivity, compensation, and unit labor costs.

The industry measures differ in methodology and data sources from the productivity measures for the major sectors because the industry measures are developed independently of the National Income and Product Accounts framework used for the major sector measures.

### Definitions

**Output per hour** is derived by dividing an index of industry output by an index of labor input. For most industries, **output** indexes are derived from data on the value of industry output adjusted for price change. For the remaining industries, output indexes are derived from data on the physical quantity of production.

The **labor input** series is based on the hours of all workers or, in the case of some transportation industries, on the number of employees. For most industries, the series consists of the hours of all employees. For some trade and services industries, the series also includes the hours of partners, proprietors, and unpaid family workers.

**Unit labor costs** represent the labor compensation costs per unit of output produced, and are derived by dividing an index of labor compensation by an index of output. **Labor compensation** includes payroll as well as supplemental payments, including both legally required expenditures and payments for voluntary programs.

**Multifactor productivity** is derived by dividing an index of industry output by an index of combined inputs consumed in producing that output. **Combined inputs** include capital, labor, and intermediate purchases. The measure of **capital input** represents the flow of services from the capital stock used in production. It is developed from measures

of the net stock of physical assets—equipment, structures, land, and inventories. The measure of **intermediate purchases** is a combination of purchased materials, services, fuels, and electricity.

### Notes on the data

The industry measures are compiled from data produced by the Bureau of Labor Statistics and the Census Bureau, with additional data supplied by other government agencies, trade associations, and other sources.

FOR ADDITIONAL INFORMATION on this series, contact the Division of Industry Productivity Studies: (202) 691-5618, or visit the Web site at: [www.bls.gov/lpc/home.htm](http://www.bls.gov/lpc/home.htm)

## International Comparisons

(Tables 51–53)

### Labor force and unemployment

#### Description of the series

Tables 51 and 52 present comparative measures of the labor force, employment, and unemployment approximating U.S. concepts for the United States, Canada, Australia, Japan, and six European countries. The Bureau adjusts the figures for these selected countries, for all known major definitional differences, to the extent that data to prepare adjustments are available. Although precise comparability may not be achieved, these adjusted figures provide a better basis for international comparisons than the figures regularly published by each country. For further information on adjustments and comparability issues, see Constance Sorrentino, “International unemployment rates: how comparable are they?” *Monthly Labor Review*, June 2000, pp. 3–20, available on the Internet at [www.bls.gov/opub/mlr/2000/06/art1full.pdf](http://www.bls.gov/opub/mlr/2000/06/art1full.pdf).

#### Definitions

For the principal U.S. definitions of the labor force, employment, and unemployment, see the Notes section on Employment and Unemployment Data: Household survey data.

#### Notes on the data

Foreign country data are adjusted as closely as possible to the U.S. definitions. Primary areas of adjustment address conceptual differences in upper age limits and defini-

tions of employment and unemployment, provided that reliable data are available to make these adjustments. Adjustments are made where applicable to include employed and unemployed persons above upper age limits; some European countries do not include persons older than age 64 in their labor force measures, because a large portion of this population has retired. Adjustments are made to exclude active duty military from employment figures, although a small number of career military may be included in some European countries. Adjustments are made to exclude unpaid family workers who worked fewer than 15 hours per week from employment figures; U.S. concepts do not include them in employment, whereas most foreign countries include all unpaid family workers regardless of the number of hours worked. Adjustments are made to include full-time students seeking work and available for work as unemployed when they are classified as not in the labor force.

Where possible, lower age limits are based on the age at which compulsory schooling ends in each country, rather than based on the U.S. standard of 16. Lower age limits have ranged between 13 and 16 over the years covered; currently, the lower age limits are either 15 or 16 in all 10 countries.

Some adjustments for comparability are not made because data are unavailable for adjustment purposes. For example, no adjustments to unemployment are usually made for deviations from U.S. concepts in the treatment of persons waiting to start a new job or passive jobseekers. These conceptual differences have little impact on the measures. Furthermore, BLS studies have concluded that no adjustments should be made for persons on layoff who are counted as employed in some countries because of their strong job attachment as evidenced by, for example, payment of salary or the existence of a recall date. In the United States, persons on layoff have weaker job attachment and are classified as unemployed.

The annual labor force measures are obtained from monthly, quarterly, or continuous household surveys and may be calculated as averages of monthly or quarterly data. Quarterly and monthly unemployment rates are based on household surveys. For some countries, they are calculated by applying annual adjustment factors to current published data and, therefore, are less precise indicators of unemployment under U.S. concepts than the annual figures. The labor force measures may have breaks in series over time due to changes in surveys, sources, or estimation methods. Breaks are noted in data tables.

For up-to-date information on adjustments and breaks in series, see the Technical

Notes of *Comparative Civilian Labor Force Statistics, 10 Countries*, on the Internet at [www.bls.gov/fls/flscomparelf.htm](http://www.bls.gov/fls/flscomparelf.htm), and the Notes of *Unemployment rates in 10 countries, civilian labor force basis, approximating U.S. concepts, seasonally adjusted*, on the Internet at [www.bls.gov/fls/flsjec.pdf](http://www.bls.gov/fls/flsjec.pdf).

FOR ADDITIONAL INFORMATION on this series, contact the Division of Foreign Labor Statistics: (202) 691-5654 or [flshelp@bls.gov](mailto:flshelp@bls.gov).

## Manufacturing productivity and labor costs

### Description of the series

Table 53 presents comparative indexes of manufacturing output per hour (labor productivity), output, total hours, compensation per hour, and unit labor costs for the United States, Australia, Canada, Japan, the Republic of Korea, Taiwan, and 10 European countries.

These measures are trend comparisons—that is, series that measure changes over time—rather than level comparisons. BLS does not recommend using these series for level comparisons because of technical problems.

BLS constructs the comparative indexes from three basic aggregate measures—output, total labor hours, and total compensation. The hours and compensation measures refer to employees (wage and salary earners) in Belgium and Taiwan. For all other economies, the measures refer to all employed persons, including employees, self-employed persons, and unpaid family workers.

The data for recent years are based on the United Nations System of National Accounts 1993 (SNA 93). Manufacturing is generally defined according to the International Standard Industrial Classification (ISIC). However, the measures for France include parts of mining as well. For the United States and Canada, it is defined according to the North American Industry Classification System (NAICS 97).

### Definitions

**Output.** For most economies, the output measures are real value added in manufacturing from national accounts. However, output for Japan prior to 1970 and for the Netherlands prior to 1960 are indexes of industrial production. The manufacturing value added measures for the United Kingdom are essentially identical to their indexes of industrial production.

For United States, the output measure for the manufacturing sector is a chain-weighted

index of real gross product originating (deflated value added) produced by the Bureau of Economic Analysis of the U.S. Department of Commerce. Most of the other economies now also use chain-weighted as opposed to a fixed-year weights that are periodically updated.

To preserve the comparability of the U.S. measures with those of other economies, BLS uses gross product originating in manufacturing for the United States. The gross product originating series differs from the manufacturing output series that BLS publishes in its quarterly news releases on U.S. productivity and costs (and that underlies the measures that appear in tables 48 and 50 in this section). The quarterly measures are on a “sectoral output” basis, rather than a value-added basis. Sectoral output is gross output less intrasector transactions.

**Total hours** refer to hours worked in all economies. The measures are developed from statistics of manufacturing employment and average hours. For most other economies, recent years’ aggregate hours series are obtained from national statistical offices, usually from national accounts. However, for some economies and for earlier years, BLS calculates the aggregate hours series using employment figures published with the national accounts, or other comprehensive employment series, and data on average hours worked.

**Hourly compensation** is total compensation divided by total hours. Total compensation includes all payments in cash or in-kind made directly to employees plus employer expenditures for legally required insurance programs and contractual and private benefit plans. For Australia, Canada, France, and Sweden, compensation is increased to account for important taxes on payroll or employment. For the United Kingdom, compensation is reduced between 1967 and 1991 to account for subsidies.

**Labor productivity** is defined as real output per hour worked. Although the labor productivity measure presented in this release relates output to the hours worked of persons employed in manufacturing, it does not measure the specific contributions of labor as a single factor of production. Rather, it reflects the joint effects of many influences, including new technology, capital investment, capacity utilization, energy use, and managerial skills, as well as the skills and efforts of the workforce.

**Unit labor costs** are defined as the cost of labor input required to produce one unit of output. They are computed as compensation in nominal terms divided by real output. Unit labor costs can also be computed by dividing hourly compensation by output per hour, that is, by labor productivity.

### Notes on the data

The measures for recent years may be based on current indicators of manufacturing output (such as industrial production indexes), employment, average hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available.

FOR ADDITIONAL INFORMATION on this series, go to <http://www.bls.gov/news.release/prod4.toc.htm> or contact the Division of Foreign Labor Statistics at (202) 691-5654.

## Occupational Injury and Illness Data

(Tables 54–55)

### Survey of Occupational Injuries and Illnesses

#### Description of the series

The Survey of Occupational Injuries and Illnesses collects data from employers about their workers’ job-related nonfatal injuries and illnesses. The information that employers provide is based on records that they maintain under the Occupational Safety and Health Act of 1970. Self-employed individuals, farms with fewer than 11 employees, employers regulated by other Federal safety and health laws, and Federal, State, and local government agencies are excluded from the survey.

The survey is a Federal-State cooperative program with an independent sample selected for each participating State. A stratified random sample with a Neyman allocation is selected to represent all private industries in the State. The survey is stratified by Standard Industrial Classification and size of employment.

#### Definitions

Under the Occupational Safety and Health Act, employers maintain records of nonfatal work-related injuries and illnesses that involve one or more of the following: loss of consciousness, restriction of work or motion, transfer to another job, or medical treatment other than first aid.

**Occupational injury** is any injury such as a cut, fracture, sprain, or amputation that results from a work-related event or a single, instantaneous exposure in the work environment.

**Occupational illness** is an abnormal

condition or disorder, other than one resulting from an occupational injury, caused by exposure to factors associated with employment. It includes acute and chronic illnesses or disease which may be caused by inhalation, absorption, ingestion, or direct contact.

**Lost workday injuries and illnesses** are cases that involve days away from work, or days of restricted work activity, or both.

**Lost workdays** include the number of workdays (consecutive or not) on which the employee was either away from work or at work in some restricted capacity, or both, because of an occupational injury or illness. BLS measures of the number and incidence rate of lost workdays were discontinued beginning with the 1993 survey. The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked, such as a Federal holiday, even though able to work.

**Incidence rates** are computed as the number of injuries and/or illnesses or lost work days per 100 full-time workers.

## Notes on the data

The definitions of occupational injuries and illnesses are from *Recordkeeping Guidelines for Occupational Injuries and Illnesses* (U.S. Department of Labor, Bureau of Labor Statistics, September 1986).

Estimates are made for industries and employment size classes for total recordable cases, lost workday cases, days away from work cases, and nonfatal cases without lost workdays. These data also are shown separately for injuries. Illness data are available for seven categories: occupational skin diseases or disorders, dust diseases of the lungs, respiratory conditions due to toxic agents, poisoning (systemic effects of toxic agents), disorders due to physical agents (other than toxic materials), disorders associated with repeated trauma, and all other occupational illnesses.

The survey continues to measure the number of new work-related illness cases which are recognized, diagnosed, and reported during the year. Some conditions, for example, long-term latent illnesses caused by exposure to carcinogens, often are difficult to relate to the workplace and are not adequately recognized and reported. These long-term latent illnesses are believed to be understated in the survey's illness measure. In

contrast, the overwhelming majority of the reported new illnesses are those which are easier to directly relate to workplace activity (for example, contact dermatitis and carpal tunnel syndrome).

Most of the estimates are in the form of incidence rates, defined as the number of injuries and illnesses per 100 equivalent full-time workers. For this purpose, 200,000 employee hours represent 100 employee years (2,000 hours per employee). Full detail on the available measures is presented in the annual bulletin, *Occupational Injuries and Illnesses: Counts, Rates, and Characteristics*.

Comparable data for more than 40 States and territories are available from the BLS Office of Safety, Health and Working Conditions. Many of these States publish data on State and local government employees in addition to private industry data.

Mining and railroad data are furnished to BLS by the Mine Safety and Health Administration and the Federal Railroad Administration. Data from these organizations are included in both the national and State data published annually.

With the 1992 survey, BLS began publishing details on serious, nonfatal incidents resulting in days away from work. Included are some major characteristics of the injured and ill workers, such as occupation, age, gender, race, and length of service, as well as the circumstances of their injuries and illnesses (nature of the disabling condition, part of body affected, event and exposure, and the source directly producing the condition). In general, these data are available nationwide for detailed industries and for individual States at more aggregated industry levels.

FOR ADDITIONAL INFORMATION on occupational injuries and illnesses, contact the Office of Occupational Safety, Health and Working Conditions at (202) 691-6180, or access the Internet at: [www.bls.gov/iif/](http://www.bls.gov/iif/)

## Census of Fatal Occupational Injuries

The Census of Fatal Occupational Injuries compiles a complete roster of fatal job-related injuries, including detailed data about the fatally injured workers and the fatal events. The program collects and cross checks fatality information from multiple sources, including

death certificates, State and Federal workers' compensation reports, Occupational Safety and Health Administration and Mine Safety and Health Administration records, medical examiner and autopsy reports, media accounts, State motor vehicle fatality records, and follow-up questionnaires to employers.

In addition to private wage and salary workers, the self-employed, family members, and Federal, State, and local government workers are covered by the program. To be included in the fatality census, the decedent must have been employed (that is working for pay, compensation, or profit) at the time of the event, engaged in a legal work activity, or present at the site of the incident as a requirement of his or her job.

## Definition

**A fatal work injury** is any intentional or unintentional wound or damage to the body resulting in death from acute exposure to energy, such as heat or electricity, or kinetic energy from a crash, or from the absence of such essentials as heat or oxygen caused by a specific event or incident or series of events within a single workday or shift. Fatalities that occur during a person's commute to or from work are excluded from the census, as well as work-related illnesses, which can be difficult to identify due to long latency periods.

## Notes on the data

Twenty-eight data elements are collected, coded, and tabulated in the fatality program, including information about the fatally injured worker, the fatal incident, and the machinery or equipment involved. Summary worker demographic data and event characteristics are included in a national news release that is available about 8 months after the end of the reference year. The Census of Fatal Occupational Injuries was initiated in 1992 as a joint Federal-State effort. Most States issue summary information at the time of the national news release.

FOR ADDITIONAL INFORMATION on the Census of Fatal Occupational Injuries contact the BLS Office of Safety, Health, and Working Conditions at (202) 691-6175, or the Internet at: [www.bls.gov/iif/](http://www.bls.gov/iif/)

Nonunion.....	3.2	3.2	.8	.9	.6	1.0	.9	.8	.6	.9	.7

<sup>1</sup> Quarterly data seasonally adjusted.

<sup>2</sup> Annual changes are December-to-December changes. Quarterly changes are calculated using the last month of each quarter.

<sup>3</sup> The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

<sup>4</sup> Excludes Federal and private household workers.

<sup>5</sup> Goods-producing industries include mining, construction, and manufacturing. Service-providing industries include all other private sector industries.

NOTE: Beginning in January 2003, household survey data reflect revised population controls. Nonfarm data reflect the conversion to the 2002 version of the North American Industry Classification System (NAICS), replacing the Standard Industrial Classification (SIC) system. NAICS-based data by industry are not comparable with SIC based data.

## 2. Annual and quarterly percent changes in compensation, prices, and productivity

<sup>1</sup> The population figures are not seasonally adjusted.

<sup>2</sup> Civilian employment as a percent of the civilian noninstitutional population.

<sup>3</sup> Beginning in 2003, persons who selected this race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race.

NOTE: Estimates for the above race groups (white and black or African American) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race. Beginning in January 2003, data reflect revised population controls used in the household survey.

<sup>1</sup> Includes workers covered by Unemployment Insurance (UI) and Unemployment Compensation for Federal Employees (UCFE) programs.

<sup>2</sup> Includes data for Metropolitan Statistical Areas (MSA) as defined by OMB Bulletin No. 04-03 as of February 18, 2004.

<sup>3</sup> Each year's total is based on the MSA definition for the specific year. Annual changes include differences resulting from changes in MSA definitions.

<sup>4</sup> Totals do not include the six MSAs within Puerto Rico.

## 27. Annual data: Employment status of the population

[Numbers in thousands]

<sup>1</sup> Cost (cents per hour worked) measured in the Employment Cost Index consists of wages, salaries, and employer cost of employee benefits.

<sup>2</sup> Consists of private industry workers (excluding farm and household workers) and State and local government (excluding Federal Government) workers.

<sup>3</sup> Consists of legislative, judicial, administrative, and regulatory activities.

NOTE: The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

<sup>1</sup> The 2002 North American Industry Classification System (NAICS) replaced the 1987 Standard Industrial Classification (SIC) System. Estimates for goods-producing and service-providing (formerly service-producing) industries are considered comparable. Also introduced was the 2000 Standard Occupational Classification (SOC) to replace the 1990 Census of Population system. Only service occupations are considered comparable.

<sup>2</sup> The white-collar and blue-collar occupation series were discontinued effective 2007.

<sup>3</sup> The take-up rate is an estimate of the percentage of workers with access to a plan who participate in the plan.

Note: Where applicable, dashes indicate no employees in this category or data do not meet publication criteria.

<sup>1</sup> The 2002 North American Industry Classification System (NAICS) replaced the 1987 Standard Industrial Classification (SIC) System. Estimates for goods-producing and service-providing (formerly service-producing) industries are considered comparable. Also introduced was the 2000 Standard Occupational Classification (SOC) to replace the 1990 Census of Population system. Only service occupations are considered comparable.

<sup>2</sup> The white-collar and blue-collar occupation series were discontinued effective 2007.

<sup>3</sup> The take-up rate is an estimate of the percentage of workers with access to a plan who participate in the plan.

Note: Where applicable, dashes indicate no employees in this category or data do not meet publication criteria.

<sup>1</sup> Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:

M—Every month.  
<sup>1</sup>—January, March, May, July, September, and November.  
<sup>2</sup>—February, April, June, August, October, and December.

<sup>2</sup> Regions defined as the four Census regions.

<sup>3</sup> Indexes on a December 1996 = 100 base.

<sup>4</sup> The "North Central" region has been renamed the "Midwest" region by the Census Bureau. It is composed of the same geographic entities.

<sup>5</sup> Indexes on a December 1986 = 100 base.

<sup>6</sup> In addition, the following metropolitan areas are published semiannually and appear in tables 34 and 39 of the January and July issues of the *CPI Detailed*

*Report:* Anchorage, AK; Cincinnati, OH—KY—IN; Kansas City, MO—KS; Milwaukee—Racine, WI; Minneapolis—St. Paul, MN—WI; Pittsburgh, PA; Portland—Salem, OR—WA; St Louis, MO—IL; San Diego, CA; Tampa—St. Petersburg—Clearwater, FL.

<sup>7</sup> Indexes on a November 1996 = 100 base.

NOTE: Local area CPI indexes are byproducts of the national CPI program. Each local index has a smaller sample size and is, therefore, subject to substantially more sampling and other measurement error. As a result, local area indexes show greater volatility than the national index, although their long-term trends are similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in their escalator clauses. Index applies to a month as a whole, not to any specific date. Dash indicates data not available.

United Kingdom.....	5.5	5.4	5.3	5.5	5.6	5.5	5.5	5.4	5.4	5.2	-

NOTE: Dash indicates data not available.

Quarterly figures for France, Germany, Italy, and the Netherlands are calculated by applying annual adjustment factors to current published data and therefore should be viewed as less precise indicators of unemployment under U.S. concepts than the annual figures. Quarterly figures for Sweden are BLS seasonally adjusted estimates derived from Swedish not seasonally adjusted data.

For further qualifications and historical annual data, see the BLS report *Comparative Civilian Labor Force Statistics, 10 Countries* (on the

Internet at <http://www.bls.gov/fls/flscomparelf.htm>). For monthly unemployment rates, as well as the quarterly and annual rates published in this table, see the BLS report *Unemployment rates in 10 countries, civilian labor force basis, approximating U.S. concepts, seasonally adjusted* (on the Internet at <http://www.bls.gov/fls/flsjec.pdf>). Unemployment rates may differ between the two reports mentioned, because the former is updated semi-annually, whereas the latter is updated monthly and reflects the most recent revisions in source data.

## 52. Annual data: employment status of the working-age population, approximating U.S. concepts, 10 countries

<sup>1</sup> Labor force as a percent of the working-age population.<sup>2</sup> Employment as a percent of the working-age population.

NOTE: Dash indicates data not available.

There are breaks in series for the United States (1998, 1999, 2000, 2003, 2004), Australia (2001), Germany (1999, 2005), the Netherlands (2000), and Sweden (2005). For further qualifications and historical annual data, see the BLS report *Comparative**Civilian Labor Force Statistics, 10 Countries* (on the Internet at <http://www.bls.gov/flscomparelf.htm>). Unemployment rates may differ from those in the BLS report *Unemployment rates in 10 countries, civilian labor force basis, approximating U.S. concepts, seasonally adjusted* (on the Internet at <http://www.bls.gov/fls/sec.pdf>), because the former is updated semi-annually, whereas the latter is updated monthly and reflects the most recent revisions in source data.

<sup>1</sup> Data for 1989 and subsequent years are based on the *Standard Industrial Classification Manual*, 1987 Edition. For this reason, they are not strictly comparable with data for the years 1985-88, which were based on the *Standard Industrial Classification Manual*, 1972 Edition, 1977 Supplement.

<sup>2</sup> Beginning with the 1992 survey, the annual survey measures only nonfatal injuries and illnesses, while past surveys covered both fatal and nonfatal incidents. To better address fatalities, a basic element of workplace safety, BLS implemented the Census of Fatal Occupational Injuries.

<sup>3</sup> The incidence rates represent the number of injuries and illnesses or lost workdays per 100 full-time workers and were calculated as (N/EH) X 200,000, where:

N = number of injuries and illnesses or lost workdays;  
EH = total hours worked by all employees during the calendar year; and  
200,000 = base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year).

<sup>4</sup> Beginning with the 1993 survey, lost workday estimates will not be generated. As of 1992, BLS began generating percent distributions and the median number of days away from work by industry and for groups of workers sustaining similar work disabilities.

<sup>5</sup> Excludes farms with fewer than 11 employees since 1976.

NOTE: Dash indicates data not available.

### 55. Fatal occupational injuries by event or exposure, 1996-2005

Event or exposure <sup>1</sup>	1996-2000 (average)	2001-2005 (average) <sup>2</sup>	2005 <sup>3</sup>	
			Number	Percent

<b>Fires and explosions</b> .....	196	174	159	3
Fires--unintended or uncontrolled .....	103	95	93	2
Explosion .....	92	78	65	1

<sup>1</sup> Based on the 1992 BLS Occupational Injury and Illness Classification Manual.

<sup>2</sup> Excludes fatalities from the Sept. 11, 2001, terrorist attacks.

<sup>3</sup> The BLS news release of August 10, 2006, reported a total of 5,702 fatal work injuries for calendar year 2005. Since then, an additional 32 job-related fatalities were identified, bringing the total job-related fatality count for 2005 to 5,734.

NOTE: Totals for all years are revised and final. Totals for major categories may include subcategories not shown separately. Dashes indicate no data reported or data that do not meet publication criteria. N.e.c. means "not elsewhere classified."
