

Highlights of Women's Earnings in 2006

U.S. Department of Labor
U.S. Bureau of Labor Statistics
September 2007

Report 1000

Introduction

In 2006, women who were full-time wage and salary workers had median weekly earnings of \$600, or about 81 percent of the \$743 median for their male counterparts. (See chart 1.) This ratio has grown since 1979 (the first year comparable earnings data were available), when women earned about 63 percent as much as men.

This report presents earnings data from the Current Population Survey (CPS). The CPS is a national monthly survey of approximately 60,000 households conducted by the U.S. Census Bureau for the U.S. Bureau of Labor Statistics. Information on earnings is collected from one-fourth of the CPS sample each month. Readers should note that the comparisons of earnings in this report are on a broad level and do not control for many factors that can be significant in explaining earnings differences. For a detailed description of the source of the data and an explanation of the concepts and definitions used, see the Technical Note.

Highlights

Following are some highlights of women's and men's earnings in 2006:

Full-time workers

- Median weekly earnings were highest for women and men aged 45 to 64. Among women, 45- to 54-year-olds had median weekly earnings of \$659, essentially the same as the \$658 median for 55- to 64-year-olds. Among men, median weekly earnings for those aged 45 to 54 (\$897) also were similar to those of 55- to 64-year-olds (\$902). Young women and men aged 16 to 24 had the lowest earnings. (See table 1.)
- The difference between women's and men's earnings was largest among those aged 45 to 64, with women earning about 73 percent as much as men in this age range. By comparison, women earned 88 percent as much as men among workers 25 to 34 years old, and the earnings ratio rose to 95 percent among 16- to 24-year-olds. (See table 1.)

- Between 1979 and 2006, the earnings gap between women and men narrowed for most major age groups. The women's-to-men's earnings ratio among 35- to 44-year-olds, for example, rose from 58 percent in 1979 to 77 percent in 2006, and the ratio for 45- to 54-year-olds rose from 57 percent to 74 percent. The earnings ratios for teenagers and for workers aged 65 and older fluctuated from 1979 to 2006, but their long-term trend has been essentially flat. (See table 12.)
- Earnings differences between women and men in 2006 were widest for Asians and for whites. Asian women and white women earned around 80 percent as much as their male counterparts. By comparison, black women and Hispanic women had earnings that were about 88 percent of those of their male counterparts. (See table 1 and chart 2.)
- Asian workers of both sexes earned more than their white, black, and Hispanic counterparts in 2006. Among women, whites (\$609) earned 87 percent as much as Asians (\$699), while blacks (\$519) and Hispanics (\$440) earned 74 and 63 percent as much, respectively. In comparison, white men (\$761) earned 86 percent as much as Asian men (\$882), black men (\$591) earned 67 percent as much, and Hispanic men (\$505), 57 percent. (See tables 1 and 13, and chart 2.)
- Across the major race and Hispanic ethnicity categories, women's inflation-adjusted earnings grew from 1979 to 2006 while those for men were mostly flat or down. Among women, growth in real earnings for white women has outpaced that of their black and Hispanic counterparts. Between 1979 and 2006, inflation-adjusted earnings for white women rose by 29 percent, while earnings growth among black and Hispanic women was 19 and 9 percent, respectively. In contrast, real earnings for white and for black men in 2006 were about the same as they were in 1979, while Hispanic men's earnings fell

by about 10 percent. Women's long-term earnings growth in part reflects gains in their education levels and their movement into higher-paying occupations over time. Although men's educational attainment also has improved since 1979, the relative gains have not been as great, nor has men's occupational distribution changed as significantly as it has for women. (See table 13.)

- Median weekly earnings varied significantly by educational level. Among women, those with less than a high school diploma earned \$358 per week in 2006, compared with \$905 for those with a college degree. Among men, high school dropouts had earnings of \$469 a week, compared with \$1,205 for college graduates. (See tables 1 and 6.)
- At all levels of education, women have fared better than men with respect to earnings growth. Although both women and men with less than a high school diploma have experienced a decline in inflation-adjusted earnings since 1979, the drop for women was significantly less than that for men—8 percent versus 28 percent. Earnings for women with college degrees have increased by about 34 percent since 1979 on an inflation-adjusted basis, while those of male college graduates have risen by 18 percent. (See table 14 and chart 3.)
- Women working full time in management, business, and financial operations occupations had median weekly earnings of \$881 in 2006. This was more than women earned in any other major occupational category. The second highest paying job group was professional and related occupations, in which women earned \$816 per week. In management, business, and finance, the highest paying occupations for women were chief executives, computer and information systems managers, management analysts, medical and health services managers, and education administrators. Within professional and related occupations, women working as pharmacists, lawyers, physicians and surgeons, computer software engineers, physical therapists, computer scientists, and computer programmers had the highest median weekly earnings. (See table 2.)
- The occupational distributions of male and female full-time workers differ significantly. Relatively few women as compared to men work in construction, production, or transportation occupations, and they are far more concentrated in administrative support jobs. Although women are more likely than men to work in professional and related occupations, they are not well represented in the higher paying job groups within this broad category. In 2006, only 9 percent of female professionals were employed in the high paying computer (\$1,166 per week) and engineering (\$1,155 per week) fields, compared with 43 percent of their male counterparts. Instead, professional women were more likely to work in education (\$819 per week) and healthcare (\$905 per week) where pay was generally lower; 67 percent worked in these fields in 2006, compared with 29 percent of male professionals. (See table 2 and chart 4.)
- The ratio of female-to-male earnings varied by place of residence, ranging from 66.3 percent in Wyoming to 89.1 percent in California. The differences among the States reflect, in part, variation in the occupations and industries found in each State and in the age composition of each State's labor force. In addition, sampling error for the State estimates is considerably larger than it is for the national estimates; thus, comparisons of State estimates should be made with care. (See table 3.)
- About 7 percent of women earned \$1,500 or more per week, compared with about 15 percent of men. Not surprisingly, given their higher earnings overall, Asian women were more likely than white, black, or Hispanic women to earn at least \$1,500 per week. (See table 7.)
- Median weekly earnings for married women and men were higher than those for their unmarried counterparts. As a group, married workers tend to be older and so are more likely to be in their prime earning years. Among married workers of both sexes, there was little difference in the earnings of those with children under age 18 and those without children. Among unmarried workers, women without children earned 13 percent more than those with children. The opposite was true among unmarried men: those with children earned 12 percent more than those with no children. (See table 8.)

Part-time workers

- Women are more likely than men to work part time, that is, fewer than 35 hours per week. Women who worked part time made up nearly one-fourth of all female wage and salary workers in 2006. In contrast, only about one-tenth of men in wage and salary jobs worked part time. These proportions have not changed much over time. (See tables 4 and 5.)
- Median weekly earnings of female part-time workers were \$213, compared with \$192 for their male counterparts. The lower earnings for men in part reflect that male part-time workers are more highly

concentrated in the youngest age groups, which typically have low earnings. About half of the male part-timers were 16 to 24 years old, compared with a little less than a third of the women. (See table 4.)

Workers paid by the hour

- About 62 percent of women and 57 percent of men employed in wage and salary jobs were paid by the hour in 2006. Women who were paid hourly rates had median hourly earnings of \$10.65. This was 84 percent of the median for men paid by the hour (\$12.68). (See tables 5, 9, 10, 15, and 16.)
- Among workers who were paid hourly rates in 2006, 2.9 percent of women and 1.5 percent of men had hourly earnings at or below the prevailing Federal minimum wage of \$5.15 an hour. Hourly paid workers aged 16 to 19 were the most likely to have earnings at or below the minimum wage. About 8 percent of teenage workers earned the prevailing Federal minimum wage or less, compared with just 1.4 percent of hourly paid workers aged 25 and older. Among those aged 20 to 24, about 4 percent had earnings at or below the minimum wage. (See tables 11 and 17. Also see the Technical Note for information about workers with earnings below the Federal minimum wage.)

Chart 1. Median usual weekly earnings of full-time wage and salary workers in constant (2006) dollars by sex, 1979–2006 annual averages

Chart 2. Median usual weekly earnings of full-time wage and salary workers by sex, race, and Hispanic or Latino ethnicity, 2006 annual averages

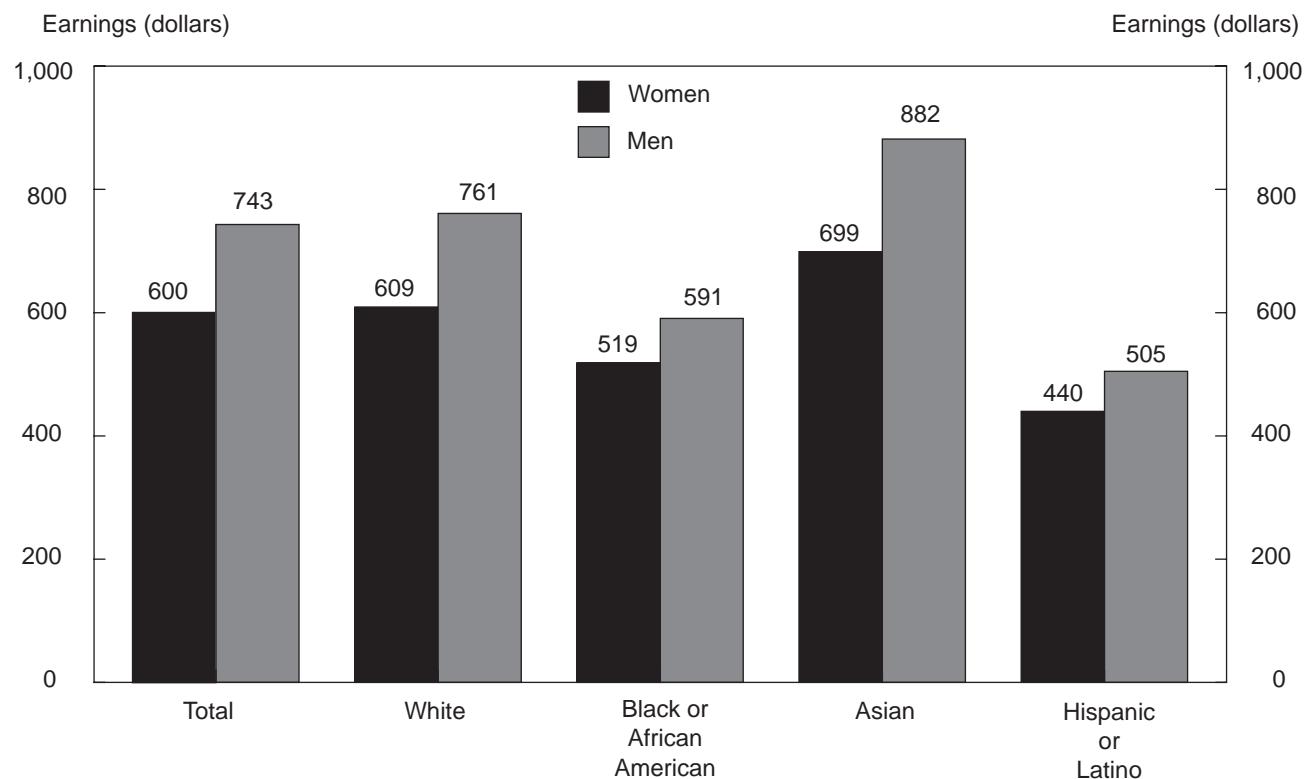

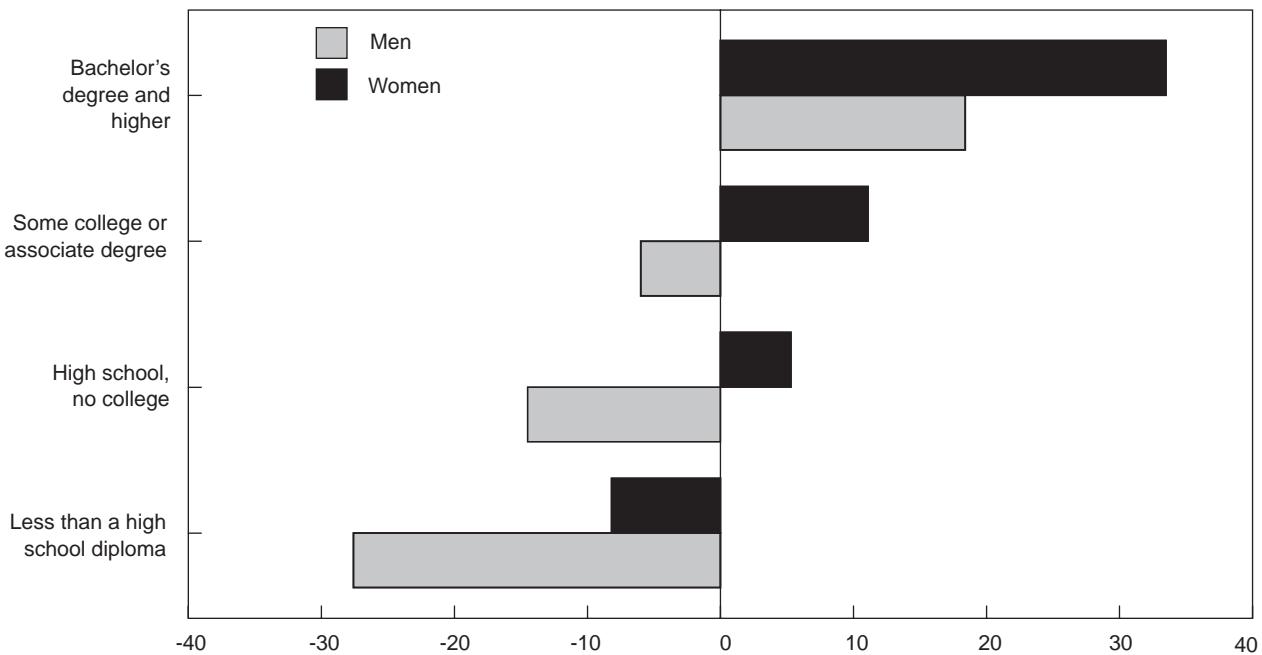

Chart 3. Change in constant-dollar median usual weekly earnings from 1979 to 2006 by educational attainment and sex

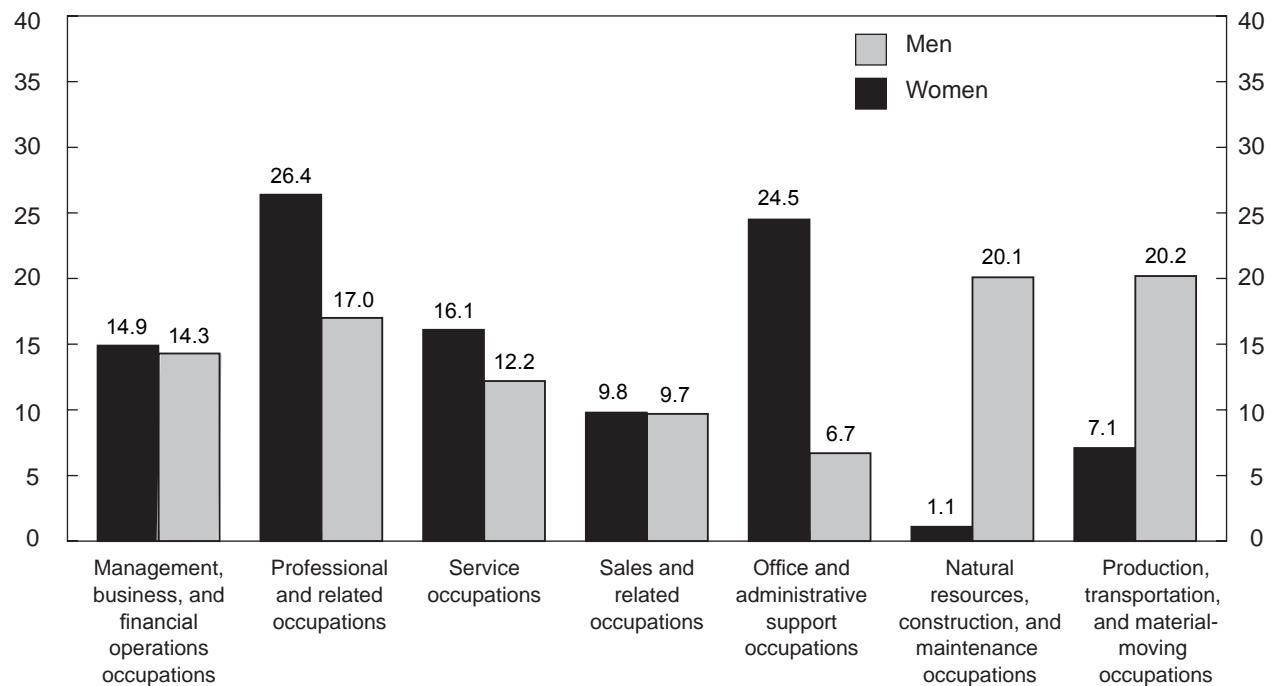

Highest educational level

Note: Data relate to earnings of full-time wage and salary workers 25 years and older.

Chart 4. Distribution of full-time wage and salary employment by sex and major occupation group, 2006 annual averages

Percent distribution of employment by sex

| EDUCATIONAL ATTAINMENT | | | | | | | | | | |
| Total, 25 years and older..... | 94,744 | 718 | 2 | 41,556 | 627 | 2 | 53,188 | 797 | 3 | 78.7 |
| Less than a high school diploma..... | 9,029 | 419 | 2 | 2,945 | 358 | 4 | 6,084 | 469 | 4 | 76.4 |
| High school, no college ⁵ | 28,023 | 595 | 2 | 11,711 | 500 | 2 | 16,313 | 678 | 4 | 73.8 |
| Some college or associate degree..... | 26,027 | 692 | 3 | 12,439 | 602 | 3 | 13,588 | 796 | 5 | 75.6 |
| Bachelor's degree and higher ⁶ | 31,665 | 1,039 | 5 | 14,461 | 905 | 5 | 17,204 | 1,205 | 11 | 75.1 |

¹ These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

² Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of male and female employees by occupation, industry, firm size, or geographic region.

³ Data refer to members of a labor union or an employee association similar to a union.

⁴ Data refer to members of a labor union or an employee association similar

to a union, as well as to workers who report no union affiliation but whose jobs are covered by a union or an employee association contract.

⁵ Includes persons with a high school diploma or equivalent.

⁶ Includes persons with a bachelor's, master's, professional, or doctoral degree.

NOTE: Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race.

| 49 to 59 hours..... | 9,699 | 1,066 | 9 | 2,818 | 985 | 13 | 6,881 | 1,115 | 12 | 88.3 |
| 60 hours or more..... | 4,711 | 1,153 | 10 | 1,069 | 982 | 27 | 3,642 | 1,196 | 17 | 82.1 |
| Hours vary..... | 8,823 | 416 | 6 | 4,112 | 295 | 6 | 4,711 | 575 | 13 | 51.4 |
| Usually less than 35 hours..... | 2,574 | 174 | 3 | 1,688 | 178 | 4 | 886 | 167 | 5 | 106.4 |
| Usually 35 hours or more..... | 5,980 | 603 | 8 | 2,305 | 459 | 11 | 3,675 | 697 | 11 | 65.8 |

¹ These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

NOTE: Data refer to the sole or principal job of full- and part-time

workers. Estimates for the above "hours vary" groups do not sum to totals because data are not presented for a small number of multiple jobholders whose usual number of hours on the principal job is not identifiable.

Table 6. Quartiles and selected deciles of usual weekly earnings of full-time wage and salary workers by selected characteristics, 2006 annual averages

| Characteristic | Number of workers (in thousands) | Upper limit of: | | | | |

¹ Includes persons with a high school diploma or equivalent.

² Includes persons with a bachelor's, master's, professional, or doctoral degree.

NOTE: Ten percent of all full-time wage and salary workers earn less than the upper limit of the first decile; 25 percent earn less than the upper limit of the first quartile; 50 percent earn less than the upper limit of the second quartile, or median; 75 percent earn less than the upper limit of the

third quartile; and 90 percent earn less than the upper limit of the ninth decile. Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race.

**Table 7. Distribution of full-time wage and salary workers by usual weekly earnings and selected characteristics,
2006 annual averages**

(In thousands)

¹ These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

² Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of male and female employees by occupation, industry, firm size, or geographic region.

³ Data refer to members of a labor union or an employee association similar to a union.

⁴ Data refer to members of a labor union or an employee association similar to

a union, as well as to workers who report no union affiliation but whose jobs are covered by a union or an employee association contract.

⁵ Includes persons with a high school diploma or equivalent.

⁶ Includes persons with a bachelor's, master's, professional, or doctoral degree.

NOTE: Workers paid by the hour account for approximately three-fifths of all wage and salary workers. Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race.

Table 10. Distribution of wage and salary workers paid hourly rates, by hourly earnings and selected characteristics, 2006 annual averages

(In thousands)

NOTE: Workers paid hourly rates represent approximately three-fifths of all wage and salary workers. Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race.

Table 11. Wage and salary workers paid hourly rates with earnings at or below the prevailing Federal minimum wage by selected characteristics, 2006 annual averages

(Numbers in thousands)

| Characteristic | Workers paid hourly rates ¹ | | | | |
|--|--|---------------------------------------|------------------------------------|---|--------------------------------------|
| | Total | Below prevailing Federal minimum wage | At prevailing Federal minimum wage | Total at or below prevailing Federal minimum wage | |
| | | | | Number | Percent of workers paid hourly rates |

| Men..... | 5,652 | 205 | 112 | 317 | 5.6 |

See footnotes at end of table.

¹ Detail may not sum to totals due to rounding. Percents are based on unrounded data.

² The distinction between full- and part-time workers is based on hours usually worked. These data do not sum to totals because full or part-time status on the principal job is not identifiable for a small number of multiple jobholders.

NOTE: Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race.

Table 12. Median usual weekly earnings of full-time wage and salary workers in constant (2006) dollars by sex and age, 1979-2006 annual averages

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Explanatory Notes and Estimates of Error section of the February 2007 and subsequent issues of *Employment and Earnings*, a monthly BLS periodical.

² These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

NOTE: As of 2003, estimates for the above race groups (white, black or African American, and Asian) include persons who selected this race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported

more than one race were included in the group they identified as the main race. Estimates for race groups do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race. Data for 2000-2002 are for the category Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. For more information, see the Explanatory Notes and Estimates of Error section of *Employment and Earnings*. Data for Asians were not tabulated prior to 2000. Dash indicates data not available. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. See Technical Note.

¹ Includes persons with a high school diploma or equivalent.

issues of *Employment and Earnings*, a monthly BLS periodical.

² Includes persons with a bachelor's, master's, professional, or doctoral degree.

⁴ These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

³ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Explanatory Notes and Estimates of Error section of the February 2007 and subsequent

NOTE: The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. See Technical Note.

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Explanatory Notes and Estimates of Error section of the February 2007 and subsequent issues of *Employment and Earnings*, a monthly BLS periodical.

slightly from percents computed using the rounded medians displayed in this table.

NOTE: The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. See Technical Note.

² These figures are computed using unrounded medians and may differ

Table 16. Median hourly earnings of wage and salary workers paid hourly rates in constant (2006) dollars by sex, race, and Hispanic or Latino ethnicity, 1979-2006 annual averages

See footnotes at end of table.

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Explanatory Notes and Estimates of Error section of the February 2007 and subsequent issues of *Employment and Earnings*, a monthly BLS periodical.

² These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

NOTE: As of 2003, estimates for the above race groups (white, black or African American, and Asian) include persons who selected this race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than

one race were included in the group they identified as the main race. Estimates for race groups do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race. Data for 2000-2002 are for the category Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. For more information, see the Explanatory Notes and Estimates of Error section of *Employment and Earnings*. Data for Asians were not tabulated prior to 2000. Dash indicates data not available. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. See Technical Note.

Table 17. Wage and salary workers paid hourly rates with earnings at or below the prevailing Federal minimum wage by sex, 1979-2006 annual averages

(Numbers in thousands)

| Year and sex | Total wage and salary workers | Workers paid hourly rates | | | | | |
|-------------------------|-------------------------------|---------------------------|--|---------------------------------------|------------------------------------|---|--------------------------------------|
| | | Total | Percent of total wage and salary workers | Below prevailing Federal minimum wage | At prevailing Federal minimum wage | Total at or below prevailing Federal minimum wage | |
| | | | | | | Number | Percent of workers paid hourly rates |

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Explanatory Notes and Estimates of Error section of the February 2007 and subsequent issues of *Employment and Earnings*, a monthly BLS periodical.

² Data for 1990-91 and 1996-97 reflect changes in the minimum wage

that took place in those years.

NOTE: The prevailing Federal minimum wage was \$2.90 in 1979, \$3.10 in 1980, and \$3.35 in 1981-89. The minimum wage rose to \$3.80 in April 1990, to \$4.25 in April 1991, to \$4.75 in October 1996, and to \$5.15 in September 1997. See Technical Note for more information about minimum wage workers.

Technical Note

The estimates in this report were obtained from the Current Population Survey (CPS), which provides a wide range of information on the labor force, employment, and unemployment. The survey is conducted monthly for the U.S. Bureau of Labor Statistics (BLS) by the U.S. Census Bureau using a national sample of about 60,000 households, with coverage in all 50 States and the District of Columbia. The earnings data are collected from one-fourth of the CPS monthly sample.

Material in this report is in the public domain and, with appropriate credit, may be used without permission. This information is available to sensory-impaired individuals upon request. Voice telephone: (202) 691-5200; Federal Relay Service: 1-800-877-8339.

Concepts and definitions

The principal concepts and definitions used in connection with the earnings data in this report are described below.

Usual weekly earnings. Data are collected on wages and salaries before taxes and other deductions, and include any overtime pay, commissions, or tips usually received (at the principal job in the case of multiple jobholders). Self-employed workers are excluded, regardless of whether their businesses are incorporated. Prior to 1994, respondents were asked how much they usually earned per week. Since January 1994, respondents have been asked to identify the easiest way for them to report earnings (hourly, weekly, biweekly, twice monthly, monthly, annually, other) and how much they usually earn in the reported period. Earnings reported on a basis other than weekly are converted to a weekly equivalent. The term "usual" is as perceived by the respondent. If the respondent asks for a definition of usual, interviewers are instructed to define the term as more than half the weeks worked during the past 4 or 5 months.

Medians (and quantiles) of weekly earnings. Most of the earnings estimates shown in this report are medians. The median (or upper limit of the second quartile) is the amount that divides a given earnings distribution into two equal groups, one having earnings above the median, and the other having earnings below the median. Ten percent of workers in a given distribution have earnings below the upper limit of the first decile (90 percent have higher earnings); 25 percent have earnings below the upper limit of the first quartile (75 percent have higher earnings); 75 percent have earnings below the upper limit of the third quartile (25 percent have higher earnings); and 90 percent have earnings below the upper limit of the ninth decile (10 percent have higher earnings).

The BLS estimating procedure for determining the median of an earnings distribution places each reported or calculated weekly earnings value into a \$50-wide interval that is centered on a multiple of \$50. The actual value of the median

is estimated through the linear interpolation of the interval in which the median lies.

Over-the-year changes in the medians (and quantile boundaries) for specific groups may not necessarily be consistent with the movements estimated for the overall quantile boundary. The most common reasons for this possible anomaly are:

- There could be a change in the relative weights of the subgroups. For example, the medians of both 16- to 24-year-olds and those 25 years and older may rise, but if the lower earning 16-to-24 age group accounts for a greatly increased share of the total, the overall median could actually fall.
- There could be a large change in the shape of the distribution of reported earnings, particularly near a quantile boundary. This could be caused by survey observations that are clustered at rounded values, for example, \$250, \$300, or \$400. An estimate lying in a \$50-wide centered interval containing such a cluster, or "spike," tends to change more slowly than one in other intervals. For example, medians measure the central tendency of a multipeaked distribution that shifts over time. As the distribution shifts, the median does not necessarily move at the same rate. Specifically, the median takes relatively more time to move through a frequently reported interval but, once above the upper limit of such an interval, it can move relatively quickly to the next frequently reported earnings interval. BLS procedures for estimating medians (and other quantile boundaries) mitigate such irregular movements of the measures; however, users should be cautious of these effects when evaluating short-term changes in the medians and in ratios of the medians.

Constant dollars. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. BLS has made numerous improvements to the Consumer Price Index (CPI) over the past quarter-century. While these improvements make the present and future CPI more accurate, historical price index series are not adjusted to reflect the improvements. Because many researchers need a historical series that measures price change consistently over the entire period, the CPI-U-RS provides an estimate of the CPI that incorporates most of the methodological improvements made since 1978 into the entire series. For further information, see "CPI research series using current methods, 1978-98" by Kenneth J. Stewart and Stephen B. Reed, *Monthly Labor Review*, June 1999, pp. 29-38; and "Questions and Answers: Consumer Price Index Research Series Using Current Methods" on the Internet at www.bls.gov/cpi/cpirsdc.htm.

This report uses the most recent version of the CPI-U-RS available at the time of production. Users should note, however, that the CPI-U-RS is subject to periodic revision. As a result, the rate of inflation incorporated into the constant-dollar earnings estimates in this report may differ from that in previous reports in this series or in other publications.

Wage and salary workers. These are workers who receive wages, salaries, commissions, tips, payment in kind, or piece rates. The group includes employees in both the private and public sectors but, for purposes of the earnings series, excludes all self-employed persons, whether or not their businesses are incorporated.

Full-time workers. Workers who usually work 35 hours or more per week at their sole or principal job are defined as working full time for estimates of earnings.

Part-time workers. Workers who usually work fewer than 35 hours per week at their sole or principal job are defined as working part time for estimates of earnings.

Workers paid by the hour. Workers who are paid an hourly wage make up approximately three-fifths of all wage and salary workers. Workers paid by the hour are, therefore, included in the full- and part-time worker tables in this report, along with salaried workers and other workers not paid by the hour. (Data for workers paid at hourly rates are presented separately in tables 9 to 11 and 15 to 17.)

Workers paid at or below the Federal minimum wage. The estimates of the numbers of workers with reported earnings at or below the Federal minimum wage in tables 11 and 17 pertain only to workers who are paid hourly rates. Salaried workers and other workers who are not paid by the hour are not included, even though some have earnings that, when converted to hourly rates, are at or below the minimum wage. Consequently, the estimates presented in this report likely underestimate the actual number of workers with hourly earnings at or below the minimum wage. Research has shown, however, that the degree of understatement is small. BLS does not routinely estimate hourly earnings for workers not paid by the hour because of data quality concerns associated with such an estimation process.

The prevailing Federal minimum wage was: \$2.90 effective January 1979; \$3.10 effective January 1980; \$3.35 effective January 1981; \$3.80 effective April 1990; \$4.25 effective April 1991; \$4.75 effective October 1996; and \$5.15 effective September 1997. Data for 1990-91 and 1996-97 in table 17 reflect changes in the minimum wage that took place during those years. It should be noted that some States have established minimum wage standards that exceed the Federal level.

The presence of workers with hourly earnings below the minimum wage does not necessarily indicate violations of the Fair Labor Standards Act, as there are exemptions to the minimum wage provisions of the law. In addition, some workers might have rounded their hourly earnings to the nearest dollar in response to survey questions. As a result, some might have been reported with hourly earnings below the minimum wage when, in fact, they earned the minimum wage or higher.

Reliability

Statistics based on the CPS are subject to both sampling and nonsampling error. When a sample, rather than an entire population, is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses generally are conducted at the 90-percent level of confidence. Estimates of earnings and their standard errors can be used to construct approximate confidence intervals, or ranges of values that include the true population value with known probabilities.

The CPS data also are affected by nonsampling error. Nonsampling error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information, and errors made in data collection or processing.

For a full discussion of the reliability of data from the CPS and information on estimating standard errors, see the "Explanatory Notes and Estimates of Error" section of Employment and Earnings, on the BLS Web site at www.bls.gov/cps/eetech_methods.pdf.
