

Highlights of Women's Earnings in 2012

and definitions used in this report, see the accompanying technical notes section.

Earnings of full-time workers

Age

Median weekly earnings were highest for women age 35 to 64 in 2012, with little difference in the earnings of 35- to 44-year-olds (\$747), 45- to 54-year-olds (\$746), and 55- to 64-year-olds (\$766). Among men, workers who were age 45 to 64 had the highest earnings, with 45- to 54-year-olds (\$994) making about the same as 55- to 64-year-olds (\$1,005). Young women and men age 16 to 24 had the lowest earnings (\$416 and \$468, respectively). (See table 1.)

Among the age groupings of those 35 years and older, women had earnings that ranged from 75 percent to 78

In 2012, women who were full-time wage and salary workers had median usual weekly earnings of \$691. On average in 2012, women made about 81 percent of the median earnings of male full-time wage and salary workers (\$854). In 1979, the first year for which comparable earnings data are available, women earned 62 percent of what men earned. (See chart 1 and tables 1 and 12.)

This report presents data highlights and statistical tables of earnings data from the Current Population Survey (CPS), a national monthly survey of approximately 60,000 households conducted by the U.S. Census Bureau for the U.S. Bureau of Labor Statistics (BLS). Information on earnings is collected from one-fourth of the CPS sample each month. It is important to note that the comparisons of earnings in this report are on a broad level and do not control for many factors that can be significant in explaining earnings differences. For a detailed description of the source of the data and an explanation of the concepts

percent of the earnings of their male counterparts. Among younger workers, the earnings differences between women and men were not as great. Among workers who were 25 to 34 years old, women earned 90 percent of what men earned; among 16- to 24-year-olds, women earned 89 percent as much as men. (See table 1.)

Between 1979 and 2012, women's-to-men's earnings ratios rose for most age groups. Among 25- to 34-year-olds, for example, the ratio increased from 68 percent in 1979 to 90 percent in 2012. The women's-to-men's earnings ratio for 45- to 54-year-olds increased from 57 percent to 75 percent. (See table 12.)

Race and ethnicity

Asian women and men earned more than their White, Black, and Hispanic or Latino counterparts in 2012. Among women, Whites (\$710) earned 92 percent as much as

Asians (\$770), while Blacks (\$599) and Hispanics (\$521) earned 78 percent and 68 percent as much as Asians, respectively. In comparison, White men (\$879) earned 83 percent as much as Asian men (\$1,055); Black men (\$665) earned 63 percent as much as Asians; and Hispanic men (\$592), 56 percent. (See chart 2 and table 1.)

Earnings differences between women and men were the most pronounced for Whites and for Asians. White women earned 81 percent as much as White men in 2012, while Asian women earned 73 percent as much as their male counterparts. In comparison, Black and Hispanic women had median earnings that were 90 percent and 88 percent, respectively, of those of their male counterparts. (See table 1.)

When adjusted for inflation, women's earnings since 1979 have increased considerably across the major race and

Chart 2

Median usual weekly earnings of full-time wage and salary workers by sex, race, and Hispanic or Latino ethnicity, 2012 annual averages

Note: Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

Source: U.S. Bureau of Labor Statistics..

Hispanic ethnicity categories. Earnings growth has been largest for White women, outpacing that of their Black and Hispanic counterparts. Between 1979 and 2012, inflation-adjusted earnings (also called constant-dollar earnings) rose by 31 percent for White women, compared with an increase of 20 percent for Black women and 13 percent for Hispanic women. In contrast, earnings for White and Black men in 2012 showed little or no change from their 1979 constant-dollar levels, while Hispanic men's earnings were down by 8 percent after adjusting for inflation. (See table 18.) Asians were not included in this analysis because comparable data for the group are not available until 2003. (See note in table 18.)

Education

Median weekly earnings vary significantly by level of educational attainment. Among both women and men age

25 and older, the weekly earnings of those without a high school diploma (\$386 for women and \$508 for men) were about two-fifths of those with a bachelor's degree or higher (\$1,001 for women and \$1,371 for men) in 2012. Women and men with a high school diploma who had not attended college earned a little more than half of what women and men with a bachelor's degree or higher did, and those with some college or an associate's degree earned around two-thirds as much as those with a bachelor's. (See table 1.)

At each level of education, women have fared better than men with respect to earnings growth. Although both women and men without a high school diploma have experienced declines in inflation-adjusted earnings since 1979, the drop for women was significantly less than that for men: a 14-percent decrease for women as opposed to a 32-percent decline for men. On an inflation-adjusted

HIGHLIGHTS OF WOMEN'S EARNINGS IN 2012

basis, earnings for women with a college degree have increased by 28 percent since 1979, while those of male college graduates have risen by 17 percent. (Data pertain to workers age 25 and older.) (See chart 3 and table 19.)

Occupation

Among both women and men, median weekly earnings for those working full time in management, business, and financial operations jobs were higher than in any other major occupational category in 2012 (\$993 for women and \$1,387 for men). Of women in management, business, and financial operations occupations, those who were chief executives, computer and information

systems managers, and management analysts had the highest median weekly earnings (\$1,730, \$1,527, and \$1,325, respectively). Among men in this job group, chief executives and architectural and engineering managers had the highest earnings (\$2,275 and \$2,116, respectively). The second highest paying occupational group for women and men was professional and related occupations (\$928 for women and \$1,267 for men). Among women in professional and related occupations, those who were pharmacists (\$1,871) and lawyers (\$1,636) had the highest earnings. For men in professional and related occupations, those who were physicians and surgeons (\$2,099), lawyers (\$2,055), and pharmacists (\$1,879) earned the most. (See table 2.)

Chart 3

Percent change in constant-dollar median usual weekly earnings, by educational attainment and sex, 1979–2012

Note: Data relate to earnings of full-time wage and salary workers, 25 years and older.

Source: U.S. Bureau of Labor Statistics.

HIGHLIGHTS OF WOMEN'S EARNINGS IN 2012

The occupational distributions of female and male full-time workers differ significantly. Compared with men, relatively few women work in construction, production, or transportation occupations, and women are far more concentrated in administrative support jobs. (See chart 4 and table 2.)

Women are more likely than men to work in professional and related occupations. Within this occupational category, though, the proportion of women employed in the higher paying job groups is much smaller than the proportion of men employed in them. In 2012, 9 percent of women in professional and related occupations were employed in the relatively high-paying computer and engineering fields, compared with 45 percent of men in this field. Women in professional and related occupations were more likely to

work in education and healthcare jobs, in which the pay is generally lower than that for computer and engineering jobs. Sixty-eight percent of women in this occupational category worked in the education and healthcare fields in 2012, compared with 30 percent of men. (See table 2.)

Status as a parent

In 2012, a little more than one-third of full-time wage and salary workers were parents of children under age 18 (36 percent of women and 37 percent of men). Among women, median weekly earnings for mothers of children under age 18 were \$680, slightly below the earnings for women without children under 18 (\$697). Among men, earnings for fathers with children under 18 were \$946, compared with \$799 for men without children under 18. (See table 7.)

Chart 4

Distribution of full-time wage and salary employment, by sex and major occupational group, 2012 annual averages

Source: U.S. Bureau of Labor Statistics.

State of residence

Median weekly earnings and women's-to-men's earnings ratios vary by state of residence. The differences among the states reflect, in part, variation in the occupations and industries found in each state and diversity in the age composition of each state's labor force. In general, the sampling error for the state estimates is considerably larger than it is for the national estimates; thus, comparisons of state estimates should be made with caution. (See table 3.)

Weekly work hours

Among full-time workers (that is, those working at a job 35 hours or more per week), men are more likely than women to have a longer workweek. Twenty-six percent of men worked 41 or more hours per week in 2012, compared with 14 percent of women who did so. Women were more likely than men to work 35 to 39 hours per week: 12 percent of women worked those hours in 2012, while 5 percent of men did. A large majority of both male and female full-time workers had a 40-hour workweek; among these workers, women earned 88 percent as much as men earned. (People who usually work 35 or more hours per week but whose hours vary were excluded from this analysis.) (See table 5.)

Earnings of part-time workers

Women are more likely than men to work part time—that is, less than 35 hours per week on a sole, or principal, job. Women who worked part time made up 26 percent of all female wage and salary workers in 2012. In contrast, 13 percent of men in wage and salary jobs worked part time. (See tables 4 and 5.)

Women and men who worked part time had similar median earnings. Median weekly earnings for female part-timers were \$236 in 2012, just slightly above the \$226 median for their male counterparts. (See table 4.)

Men who work part time tend to be younger than women who work part time. In 2012, 43 percent of male part-time workers were 16 to 24 years old, compared with 29 percent of female part-time workers who were that age. (See table 4.)

Earnings of workers paid by the hour

Sixty-two percent of women and 56 percent of men employed in wage and salary jobs were paid by the hour in 2012. Women who were paid hourly rates had median hourly earnings of \$11.99, which was 86 percent of the median for men paid by the hour (\$13.88). (See tables 8 and 11.)

Among workers who were paid hourly rates in 2012, 6 percent of women and 3 percent of men had hourly earnings at or below the prevailing federal minimum wage of \$7.25. (See table 10.)

Among both women and men, hourly paid workers age 16 to 19 were the most likely to have earnings at or below the minimum wage. Twenty-one percent of teenage workers who were paid hourly rates earned the prevailing federal minimum wage or less in 2012, compared with just 3 percent of hourly paid workers age 25 and older. Nine percent of hourly paid workers who were age 20 to 24 had earnings at or below the minimum wage. (See table 10.)

¹ Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of male and female employees by occupation, industry, firm size, and geographic region.

² Data refer to members of a labor union or an employee association similar to a union.

³ Data refer to workers who report no union affiliation but whose jobs are covered by a union or an employee association contract, as well as to members of a labor union or an employee association similar to a union.

Note: Estimates for the race groups listed (White, Black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

¹ Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of male and female employees by occupation, industry, firm size, and geographic region.

² Data refer to members of a labor union or an employee association similar to a union.

³ Data refer to workers who report no union affiliation but whose jobs are covered by a union or an employee association contract, as well as to members of a labor union or an employee association similar to a union.

Note: Workers paid hourly rates represented 59 percent of all wage and salary workers in 2012. Estimates for the race groups listed (White, Black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

HIGHLIGHTS OF WOMEN'S EARNINGS IN 2012

Table 10. **Wage and salary workers paid hourly rates with earnings at or below the prevailing federal minimum wage, by selected characteristics, 2012 annual averages (continued)**

(Numbers in thousands)

Characteristic	Workers paid hourly rates				
	Total	Below prevailing federal minimum wage	At prevailing federal minimum wage	Total at or below prevailing federal minimum wage	
				Number	Percent of workers paid hourly rates
Race and Hispanic or Latino Ethnicity					
White.....	59,180	1,575	1,185	2,760	4.7
Women.....	29,490	1,035	741	1,776	6.0
Men.....	29,691	540	444	984	3.3
Black or African American.....	10,049	256	277	533	5.3
Women.....	5,527	157	193	350	6.3
Men.....	4,522	98	85	183	4.0
Asian.....	3,403	69	48	117	3.4
Women.....	1,835	46	32	78	4.3
Men.....	1,568	23	16	39	2.5
Hispanic or Latino ethnicity.....	14,404	381	337	718	5.0
Women.....	6,290	213	210	423	6.7
Men.....	8,114	168	127	295	3.6
Full- and Part-time Status and Sex¹					
Full-time workers.....	54,745	760	501	1,261	2.3
Women.....	24,693	466	304	770	3.1
Men.....	30,052	294	197	491	1.6
Part-time workers.....	20,411	1,223	1,063	2,286	11.2
Women.....	13,413	820	693	1,513	11.3
Men.....	6,998	402	370	772	11.0

¹ The distinction between full-time and part-time workers is based on hours usually worked. These data do not sum to totals because full-time or part-time status on the principal or main job is not identifiable for a small number of multiple jobholders.

Note: The prevailing federal minimum wage was \$7.25 in 2012. See the technical notes section for more information about minimum wage workers. Estimates for the race groups listed (White, Black or African American, and Asian) do not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as Hispanic or Latino may be of any race.

2012.....	65,898	37,113	56.3	696	567	1,263	3.4

¹ Data for 1990–1991, 1996–1997, and 2007–2009 reflect changes in the minimum wage that took place in those years.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at www.bls.gov/cps/documentation.htm#comp. The prevailing federal minimum wage was \$2.90 in 1979, \$3.10 in 1980, and \$3.35 in 1981–1989. The minimum wage rose to \$3.80 in April 1990, to \$4.25 in April 1991, to \$4.75 in October 1996, to \$5.15 in September 1997, to \$5.85 in July 2007, to \$6.55 in July 2008, and to \$7.25 in July 2009. See the technical notes section for more information about minimum wage workers.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at www.bls.gov/cps/documentation.htm#comp. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. See the technical notes section.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at www.bls.gov/cps/documentation.htm#comp. Persons whose ethnicity is identified as Hispanic or Latino may be of any race. As of 2003, estimates for the race groups listed (White, Black or African American, and Asian) include persons who selected that race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race. Asian data for 2000–2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. See the technical notes section.

Dash indicates data not available.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at www.bls.gov/cps/documentation.htm#comp. Persons whose ethnicity is identified as Hispanic or Latino may be of any race. As of 2003, estimates for the race groups listed (White, Black or African American, and Asian) include persons who selected that race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race. Asian data for 2000–2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. See the technical notes section.

Dash indicates data not available.

2012.....	854	879	665	1,055	592

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at www.bls.gov/cps/documentation.htm#comp. Persons whose ethnicity is identified as Hispanic or Latino may be of any race. As of 2003, estimates for the race groups listed (White, Black or African American, and Asian) include persons who selected that race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race. Asian data for 2000–2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000.

Dash indicates data not available.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at www.bls.gov/cps/documentation.htm#comp. Persons whose ethnicity is identified as Hispanic or Latino may be of any race. As of 2003, estimates for the race groups listed (White, Black or African American, and Asian) include persons who selected that race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race. Asian data for 2000–2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000.

Dash indicates data not available.

Technical Notes

The estimates in this report were obtained from the Current Population Survey (CPS), which provides a wide range of information on the labor force, employment, and unemployment. The survey is conducted monthly for the U.S. Bureau of Labor Statistics (BLS) by the U.S. Census Bureau, using a scientifically selected national sample of about 60,000 eligible households, with coverage in all 50 states and the District of Columbia. The earnings data are collected from one-fourth of the CPS monthly sample and are limited to wage and salary workers. (Self-employed workers, both incorporated and unincorporated, are excluded from CPS earnings estimates.) The data, therefore, exclude self-employment income.

Material in this report is in the public domain and may be used without permission. This information is available to sensory-impaired individuals upon request. Voice telephone: (202) 691-5200; Federal Relay Service: 1 (800) 877-8339.

Concepts and definitions

The principal concepts and definitions used in connection with the earnings data in this report are described briefly below.

Usual weekly earnings. The data represent earnings before taxes and other deductions and include any overtime pay, commissions, or tips usually received (at the main job in the case of multiple jobholders). Prior to 1994, respondents were asked how much they usually earned per week. Since January 1994, respondents have been asked to identify the easiest way for them to report earnings (hourly, weekly, biweekly, twice monthly, monthly, annually, or other) and how much they usually earn in the reported time period. Earnings reported on a basis other than weekly are converted to a weekly equivalent. The definition of the term “usual” is determined by each respondent’s own understanding of the term. If the respondent asks for a

definition of “usual,” interviewers are instructed to define the term as more than half the weeks worked during the past 4 or 5 months.

Medians (and other quantiles) of weekly earnings. Most of the earnings estimates shown in this report are medians. The median (or upper limit of the second quartile) is the midpoint in a given earnings distribution, with half of workers having earnings above the median and the other half having earnings below the median. Ten percent of a given distribution have earnings below the upper limit of the first decile (90 percent have higher earnings), 25 percent have earnings below the upper limit of the first quartile (75 percent have higher earnings), 75 percent have earnings below the upper limit of the third quartile (25 percent have higher earnings), and 90 percent have earnings below the upper limit of the ninth decile (10 percent have higher earnings).

The BLS procedure for estimating the median of an earnings distribution places each reported or calculated weekly earnings value into a \$50-wide interval that is centered around a multiple of \$50. The median is calculated through the linear interpolation of the interval in which the median lies.

Over-the-year changes in the medians (and other quantile boundaries) for specific groups may not necessarily be consistent with the movements estimated for the overall quantile boundary. The most common reasons for this possible anomaly are as follows:

- There could be a change in the relative weights of the subgroups. For example, the median earnings of 16- to 24-year-olds and the median earnings of those 25 years and older may rise, but if the lower earning 16-to-24 age group accounts for a greatly increased share of the total, the overall median could actually fall.
- There could be a large change in the shape of the distribution of reported earnings, particularly near a quantile boundary. This change could be caused by survey observations that are clustered at rounded values, such as \$400 or \$500. An estimate lying in a

\$50-wide centered interval containing such a cluster tends to change more slowly than one in other intervals. Consider, for example, the calculation of the median for a multipeaked distribution that shifts over time. As such a distribution shifts, the median does not necessarily move at the same rate. Specifically, the median takes relatively more time to move through a frequently reported earnings interval, but once above the upper limit of such an interval, it can move relatively quickly to the next frequently reported interval. BLS procedures for estimating medians (and other quantile boundaries) mitigate such irregular movements; however, users should be cautious of these effects when evaluating short-term changes in the medians and in ratios of the medians.

Constant dollars. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. BLS has made numerous improvements to the Consumer Price Index (CPI) over the years. Although these improvements make the CPI more accurate, the official histories of price index series are not adjusted to reflect the improvements. Because many researchers need a historical series that measures price change consistently over time, BLS developed the CPI-U-RS to provide an estimate of the CPI that incorporates most of the methodological improvements made since 1978 into the entire series. For further information, see Kenneth J. Stewart and Stephen B. Reed, "CPI research series using current methods, 1978–98," *Monthly Labor Review*, June 1999, available at www.bls.gov/opub/mlr/1999/06/art4full.pdf; and "Questions and Answers: Consumer Price Index Research Series Using Current Methods," at www.bls.gov/cpi/cpirsq.pdf.

This report uses the most recent version of the CPI-U-RS available at the time of production. Users should note, however, that the CPI-U-RS is subject to periodic revision. As a result, the rate of inflation incorporated into the constant-dollar earnings estimates in this report may differ from that in previous reports in this series or in other publications.

Wage and salary workers. These are workers who receive wages, salaries, commissions, tips, payment in kind, or piece rates. The group includes employees in both the private and public sectors but, for purposes of the earnings series, it excludes all self-employed persons, both those with incorporated businesses and those with unincorporated businesses.

Full-time workers. For the purpose of producing estimates of earnings, workers who usually work 35 hours or more per week at their sole or principal job are defined as working full time.

Part-time workers. For the purpose of producing estimates of earnings, workers who usually work fewer than 35 hours per week at their sole or principal job are defined as working part time.

Workers paid by the hour. Historically, workers paid an hourly wage have made up approximately three-fifths of all wage and salary workers. Workers paid by the hour are included in the full- and part-time worker tables in this report, along with salaried workers and other workers not paid by the hour. Data for workers paid at hourly rates are presented separately in tables 8–11, 15–16, 20–21, and 25–26.

Workers paid at or below the federal minimum wage. The estimates of the numbers of workers with reported earnings at or below the federal minimum wage in tables 10 and 11 pertain only to workers who are paid hourly rates. Salaried workers and other workers who are not paid by the hour are excluded, even though some have earnings that, if converted to hourly rates, would be at or below the minimum wage. Consequently, the estimates presented in this report likely understate the actual number of workers with hourly earnings at or below the minimum wage. Research has shown, however, that the degree of understatement is small. BLS does not routinely estimate the hourly earnings of workers not paid by the hour because of data quality concerns associated with such an estimation process.

The prevailing federal minimum wage was \$2.90, effective January 1, 1979; \$3.10, effective January 1, 1980; \$3.35, effective January 1, 1981; \$3.80, effective April 1, 1990; \$4.25, effective April 1, 1991; \$4.75, effective October 1, 1996; \$5.15, effective September 1, 1997; \$5.85, effective July 24, 2007; \$6.55, effective July 24, 2008; and \$7.25, effective July 24, 2009. Data for 1990–1991, 1996–1997, and 2007–2009 reflect changes in the minimum wage that took place during those years. It should be noted that a number of states have established minimum-wage rates that exceed the federal level.

The presence of workers with hourly earnings below the minimum wage does not necessarily indicate violations of the Fair Labor Standards Act (FLSA), because there are a number of exemptions to the minimum-wage provisions of the law. In addition, some workers might have rounded their hourly earnings in response to survey questions. As a result, some might have reported hourly earnings below the minimum wage when, in fact, they earned the minimum wage or higher.

Race. In the survey process, race is determined by the household respondent. In accordance with the Office of Management and Budget guidelines, White, Black or African American, and Asian are terms used to describe a person's race. Beginning in 2003, people in these categories are those who selected that race group only. Those who identify multiple race groups are categorized as persons of two or more races. Previously, people identified a group as their main race. More information on the 2003 changes to questions on race is available at www.bls.gov/cps/rvceps03.pdf. Data for American Indians and Alaska Natives, Native Hawaiians and Other Pacific Islanders, and persons of two or more races are not included in this report because the number of survey respondents is too small to develop estimates of sufficient quality.

Hispanic or Latino ethnicity. This refers to people who identified themselves in the survey process as being Spanish, Hispanic, or Latino. People whose ethnicity is identified as Hispanic or Latino may be of any race.

Reliability

Statistics based on the CPS are subject to both sampling and nonsampling error. When a sample, rather than the entire population, is surveyed, there is a chance that the sample estimates may differ from the true population values they represent. The component of this difference that occurs because samples differ by chance is known as sampling error, and its variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the true population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

Estimates of earnings and their standard errors can be used to construct approximate confidence intervals, or ranges of values, that include the true population value with known probabilities.

The CPS data also are affected by nonsampling error. Nonsampling error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information on all respondents in the sample, inability or unwillingness of respondents to provide correct information, and errors made in the collection or processing of the data.

Additional information about reliability of data from the CPS and guidance on estimating standard errors is available at www.bls.gov/cps/documentation.htm#reliability.
