Employer-Reported Workplace Injuries and Illnesses in Connecticut —2017

Connecticut’s private industry employers reported 37,600 nonfatal workplace injuries and illnesses in 2017, resulting in an incidence rate of 3.2 cases per 100 equivalent full-time workers, the U.S. Bureau of Labor Statistics reported today. (See [table A.](#)) Regional Commissioner Deborah A. Brown noted that Connecticut was among 20 states that had an incidence rate of total recordable cases (TRC) significantly higher than the national rate of 2.8. (Connecticut was 1 of 41 states for which statewide estimates are available. See Technical Note at the end of this release for more information about the survey.)

Connecticut’s findings from the 2017 Survey of Occupational Injuries and Illnesses include:

- TRC incidence rates in private industry ranged from 0.5 in financial activities to 5.1 in education and health services. (See [table 1.](#))
- Two supersectors accounted for over 60 percent of the occupational injuries and illnesses while about 44 percent of total employment statewide: education and health services; and trade, transportation, and utilities. (See [table 2.](#))
- In private industry, the TRC injury and illness incidence rate ranged from 1.8 for small establishments (those employing fewer than 11 workers) to 4.1 for mid-size establishments (those employing between 50 and 249 workers). (See [table 3.](#))
- Connecticut’s private industry TRC incidence rate of 3.2 in 2017 was not significantly different than the rate in 2016. (See [table 4.](#))

Table A. Number and rate of nonfatal occupational injuries and illnesses in private industry, United States and Connecticut, 2017

Characteristic	United States		Connecticut	
	Number (in thousands)	Rate (per 100 workers)	Number (in thousands)	Rate (per 100 workers)
Total cases	2,811.5	2.8	37.6	3.2
Cases with days away from work, job transfer, or restriction	1,528.0	1.5	22.2	1.9
Cases with days away from work	882.7	0.9	14.1	1.2
Cases with job transfer or restriction	645.3	0.7	8.1	0.7
Other recordable cases	1,283.5	1.3	15.5	1.3

Note: Because of rounding, components may not add to totals.

Private industry injury and illness case types

Of the 37,600 private industry injury and illness cases reported in Connecticut, approximately 22,200 were of a more severe nature, involving days away from work, job transfer, or restriction—commonly referred to as DART cases. These cases occurred at a rate of 1.9 cases per 100 full-time workers. About 64 percent of the DART cases in Connecticut were incidents that resulted in at least one day away from work, compared with 58 percent nationally. Other recordable cases (those not involving days away from work, job transfer, or restriction) accounted for approximately 15,500 cases in Connecticut, at a rate of 1.3. In comparison, the national rate for other recordable cases was also 1.3.

The natural resources and mining supersector had a significant decrease in its DART incidence rate from a year ago. No other supersector had a significant change in either the TRC or DART rate from a year ago.

In 2017, 36,300 (96.5 percent) of private industry recordable injuries and illnesses were injuries. Workplace illnesses accounted for an additional 1,300 recordable cases. Three categories—skin disease, hearing loss, and respiratory conditions—accounted for 38 percent of the occupational illnesses in Connecticut. Nationally, these three categories amounted for 34 percent of the work-related illness total.

State and local government injury and illness cases

Among the state and local government workers in Connecticut, approximately 8,900 injury and illness cases were reported in 2017, resulting in a rate of 6.2 cases per 100 full-time workers. Nationally, the rate was 4.6. About 75 percent of injuries and illnesses reported in Connecticut’s public sector occurred among local government workers.

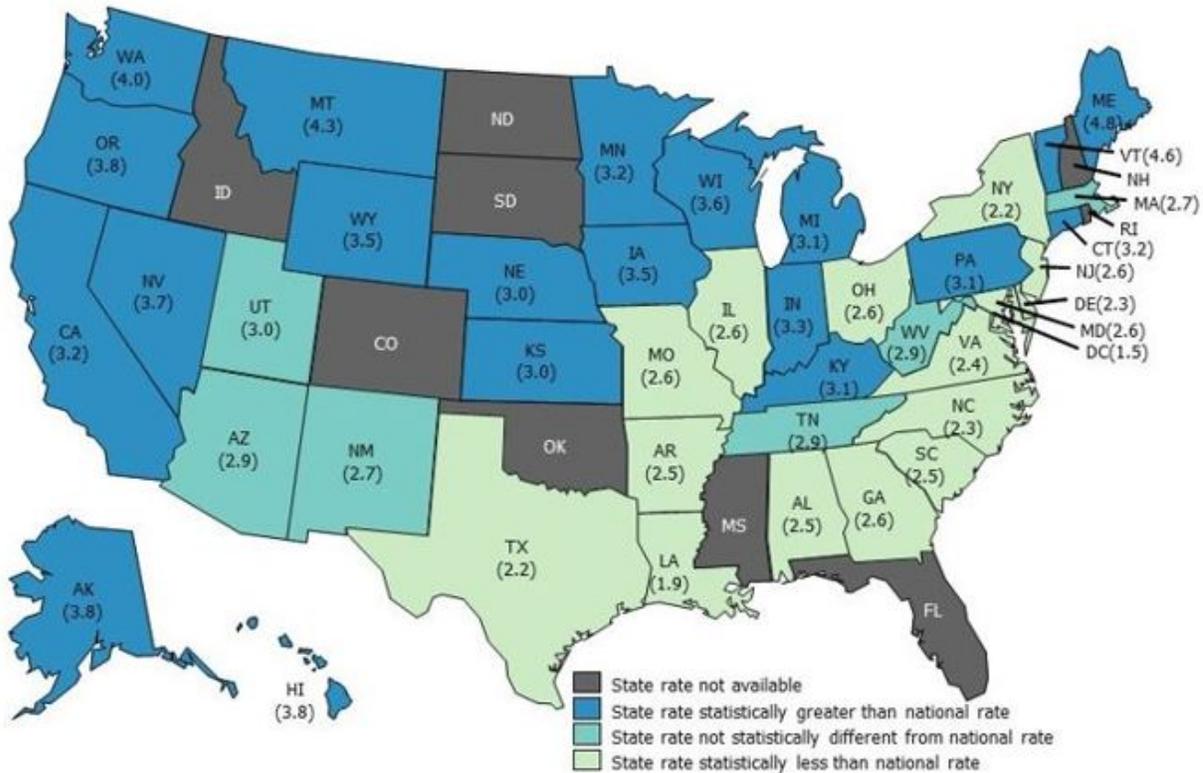

State estimates and over-the-year change

For 2017, occupational injury and illness data are available for 41 participating states and the District of Columbia. Twenty states, including Connecticut, had private industry TRC incidence rates statistically higher than the national rate of 2.8 cases per 100 full-time workers. (See [chart 1.](#)) Fifteen states and the District of Columbia had TRC rates significantly below the national rate. Six states had TRC rates that were not statistically different from the national rate.

Compared to 2016, private industry TRC incidence rates declined in eight states. The private industry TRC incidence rate was relatively unchanged in 33 states, including Connecticut, and in the District of Columbia. Estimates for nine states were not available in 2017 for comparison. Differences in the industry composition in each state account for some of the differences in injury and illness incidence rates across states.

Technical Note

The Survey of Occupational Injuries and Illnesses (SOII) is a Federal/State program in which employer's reports are collected annually from approximately 200,000 private industry and public sector (State and local government) establishments and processed by State agencies in cooperation with the Bureau of Labor Statistics. Summary information on the number of injuries and illnesses is transcribed by these employers directly from their recordkeeping logs to the survey questionnaire. The questionnaire also asks for the number of employee hours worked (needed in the calculation of incidence rates) as well as its annual average employment (needed to verify the unit's employment-size class).

Occupational injury and illness data for establishments in coal, metal, and nonmetal mining industries and for railroad activities are provided by the Department of Labor's Mine Safety and Health Administration (MSHA) and the Department of Transportation's Federal Railroad Administration (FRA), respectively. The SOII excludes all work-related fatalities as well as nonfatal work injuries and illnesses to the self-employed; to workers on farms with 10 or fewer employees; to private household workers; to volunteers; and to federal government workers.

Injuries and illnesses logged by employers conform to definitions and recordkeeping guidelines set by the Occupational Safety and Health Administration (OSHA), U.S. Department of Labor. Under OSHA guidelines, nonfatal cases are recordable if they are occupational injuries or illnesses which involve lost worktime, medical treatment other than first aid, restriction of work or motion, loss of consciousness, or transfer to another job. Employers record injuries separate from illnesses and also identify for each whether a case involved any days away from work or days of restricted work activity, or both, beyond the day of injury or onset of illness.

Survey estimates are based on a scientifically selected sample of establishments, some of which represent only themselves, but most of which also represent other employers of like industry and workforce size that were not chosen to report data in a given survey year.

The incidence rates presented in this release represent the number of injuries and/or illnesses per 100 full-time equivalent workers and were calculated as:

$(N / EH) \times 200,000$ where,

N = number of injuries and/or illnesses

EH = total hours worked by all employees during the calendar year

200,000 = base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year)

Background and methodological information regarding the BLS occupational safety and health statistics program can be found in Chapter 9 of the BLS Handbook of Methods at www.bls.gov/opub/hom/soii/home.htm

Additional occupational injury and illness data are available from our regional web page at www.bls.gov/regions/new-england. Information in this release will be made available to sensory impaired individuals upon request. Voice phone: (202)-691-5200; Federal Relay Service: (800)-877-8339.

Footnotes:

(1) Excludes farms with fewer than 11 employees.

(2) Data for mining (Sector 21 in the North American Industry Classification System, 2012 edition) include establishments not governed by the Mine Safety and Health Administration (MSHA) rules and reporting, such as those in oil and gas extraction and related support activities. Data for mining operators in coal, metal, and nonmetal mining are provided to BLS by the Mine Safety and Health Administration, U.S. Department of Labor. Independent mining contractors are excluded from the coal, metal, and nonmetal mining industries. These data do not reflect the changes the Occupational Safety and Health Administration made to its recordkeeping requirements effective January 1, 2002; therefore estimates for these industries are not comparable to estimates in other industries.

(3) Data for employers in rail transportation are provided to BLS by the Federal Railroad Administration, U.S. Department of Transportation.

(4) Days-away-from-work cases include those that result in days away from work with or without job transfer or restriction.

(5) Data do not meet publication guidelines.

Note: Because of rounding, components may not add to totals. Dashes indicate data not available.

Incidence rates represent the number of injuries and illnesses per 100 full-time workers and were calculated as: $(N/EH) \times 200,000$ where: N = number of injuries and illnesses; EH = total hours worked by all employees during the calendar year; and 200,000 = base for 100 equivalent full-time workers (working 40 hours per week, 50 weeks per year).
