Employer-Reported Workplace Injuries and Illnesses in Hawaii – 2015

Over 13,000 nonfatal workplace injuries and illnesses were reported among Hawaii’s private industry employers in 2015, resulting in an incidence rate of 3.4 cases per 100 equivalent full-time workers, the U.S. Bureau of Labor Statistics reported today. (See [table A.](#)) Assistant Commissioner for Regional Operations Richard Holden noted that Hawaii was among 21 states that had an incidence rate of total recordable cases (TRC) greater than the national rate of 3.0. (Hawaii was 1 of 41 states and the District of Columbia for which statewide estimates are available. See Technical Note at the end of this release for more information about the survey.)

Hawaii’s findings from the 2015 Survey of Occupational Injuries and Illnesses include:

- TRC incidence rates in private industry ranged from 2.3 in professional and business services to 4.7 in leisure and hospitality. (See [table 1.](#))
- Two supersectors, with about 45 percent of private industry employment, accounted for 56 percent of the occupational injuries and illnesses: leisure and hospitality and trade, transportation, and utilities. (See [table 2.](#))
- In private industry, the TRC injury and illness incidence rate ranged from 1.1 for small establishments (those employing fewer than 11 workers) to 5.2 for large establishments (those employing over 1,000 workers). (See [table 3.](#))
- Hawaii’s private industry TRC rate of 3.4 in 2015 was similar to the rate in 2014. (See [table 4.](#))

Table A. Number and rate of nonfatal occupational injuries and illnesses in private industry, United States and Hawaii, 2015

Characteristic	United States		Hawaii	
	Number (in thousands)	Rate (per 100 workers)	Number (in thousands)	Rate (per 100 workers)
Total cases	2,905.9	3.0	13.1	3.4
Cases with days away from work, job transfer, or restriction	1,571.9	1.6	7.9	2.1
Cases with days away from work	902.2	0.9	6.7	1.8
Cases with job transfer or restriction	669.8	0.7	1.2	0.3
Other recordable cases	1,333.9	1.4	5.3	1.4

Private industry injury and illness case types

Of the 13,100 private industry injury and illness cases reported in Hawaii, 7,900 were of a more severe nature, involving days away from work, job transfer, or restriction—commonly referred to as DART cases. These cases occurred at a rate of 2.1 cases per 100 full-time workers. Eighty-five percent of the DART cases in

Hawaii were incidents that resulted in at least one day away from work, compared to 57 percent nationally. Other recordable cases (those not involving days away from work, job transfer, or restriction) accounted for the remaining 5,300 cases in Hawaii, at a rate of 1.4, equal to the national rate.

In Hawaii, the information supersector experienced a significant change in both TRC and DART incidence rates from 2014, with rates increasing over the year. Construction experienced a significant decrease in the TRC rate from the previous year. No other supersector had a significant change in its TRC or DART incidence rate over the year.

In 2015, approximately 12,700 (96.9 percent) of private industry recordable injuries and illnesses were injuries. Workplace illnesses accounted for an additional 400 recordable cases. Two categories—skin disorders and respiratory conditions—accounted for 50 percent of the occupational illnesses in Hawaii. Nationally, these two categories amounted to 24 percent of the work-related illness total.

State and local government injury and illness cases

Among the state and local government sector in Hawaii, 2,500 injury and illness cases were reported in 2015, resulting in a rate of 3.6 cases per 100 full-time workers. Nationally, the rate was 5.1. Fifty-six percent of injuries and illnesses reported in Hawaii's public sector occurred among state government workers.

State estimates and over-the-year change

For 2015, occupational injury and illness data are available for 41 states and the District of Columbia. Twenty-one states, including Hawaii, had private industry TRC incidence rates higher than the national rate of 3.0 cases per 100 full-time workers in 2015. (See [chart 1.](#)) Twelve states and the District of Columbia had TRC rates lower than the national rate. Eight states had TRC rates that were about the same as the national rate. Factors such as differences in the composition of industry employment may influence state incidence rates and should be considered when comparing rates among different states.

Compared to 2014, private industry TRC incidence rates declined in nine states. The private industry TRC incidence rate was relatively unchanged in 32 states, including Hawaii, and in the District of Columbia. Estimates for nine states were not available in 2015 for comparison.

Chart 1. State nonfatal occupational injury and illness incidence rates, private industry, 2015

Technical Note

The Survey of Occupational Injuries and Illnesses (SOII) is a Federal/State program in which employer's reports are collected annually from approximately 200,000 private industry and public sector (State and local government) establishments and processed by State agencies in cooperation with the Bureau of Labor Statistics. Summary information on the number of injuries and illnesses is transcribed by these employers directly from their recordkeeping logs to the survey questionnaire. The questionnaire also asks for the number of employee hours worked (needed in the calculation of incidence rates) as well as its annual average employment (needed to verify the unit's employment-size class).

Occupational injury and illness data for establishments in coal, metal, and nonmetal mining industries and for railroad activities are provided by the Department of Labor's Mine Safety and Health Administration (MSHA) and the Department of Transportation's Federal Railroad Administration (FRA), respectively. The SOII excludes all work-related fatalities as well as nonfatal work injuries and illnesses to the self-employed; to workers on farms with 10 or fewer employees; to private household workers; to volunteers; and to federal government workers.

Injuries and illnesses logged by employers conform to definitions and recordkeeping guidelines set by the Occupational Safety and Health Administration (OSHA), U.S. Department of Labor. Under OSHA guidelines, nonfatal cases are recordable if they are occupational injuries or illnesses which involve lost work time, medical treatment other than first aid, restriction of work or motion, loss of consciousness, or transfer to

another job. Employers record injuries separate from illnesses and also identify for each whether a case involved any days away from work or days of restricted work activity, or both, beyond the day of injury or onset of illness.

Survey estimates are based on a scientifically selected sample of establishments, some of which represent only themselves, but most of which also represent other employers of like industry and workforce size that were not chosen to report data in a given survey year.

The incidence rates presented in this release represent the number of injuries and/or illnesses per 100 full-time equivalent workers and were calculated as:

$(N / EH) \times 200,000$ where,

N = number of injuries and/or illnesses

EH = total hours worked by all employees during the calendar year

200,000 = base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year)

Background and methodological information regarding the BLS occupational safety and health statistics program can be found in Chapter 9 of the BLS Handbook of Methods at www.bls.gov/opub/hom/pdf/homch9.pdf.

Additional occupational injury and illness data are available from our regional web page at www.bls.gov/regions/west.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: (202)-691-5200; Federal Relay Service: (800)-877-8339.

State government.....	2.6	1.7	1.6	0.1	0.9
Local government.....	6.7	5.0	5.0	(5)	1.7

Footnotes:

(1) Excludes farms with fewer than 11 employees.

(2) Data for mining (Sector 21 in the North American Industry Classification System, 2012 edition) include establishments not governed by the Mine Safety and Health Administration (MSHA) rules and reporting, such as those in oil and gas extraction and related support activities. Data for mining operators in coal, metal, and nonmetal mining are provided to BLS by the Mine Safety and Health Administration, U.S. Department of Labor. Independent mining contractors are excluded from the coal, metal, and nonmetal mining industries. These data do not reflect the changes the Occupational Safety and Health Administration made to its recordkeeping requirements effective January 1, 2002; therefore estimates for these industries are not comparable to estimates in other industries.

(3) Data for employers in rail transportation are provided to BLS by the Federal Railroad Administration, U.S. Department of Transportation.

(4) Days-away-from-work cases include those that result in days away from work with or without job transfer or restriction.

(5) Data do not meet publication guidelines.

Note: Dashes indicate data not available.

Incidence rates represent the number of injuries and illnesses per 100 full-time workers and were calculated as: $(N/EH) \times 200,000$ where: N = number of injuries and illnesses; EH = total hours worked by all employees during the calendar year; and 200,000 = base for 100 equivalent full-time workers (working 40 hours per week, 50 weeks per year).
